## INTRODUCTION

Since the latter part of the nineteenth century, branch libraries and other extension agencies have been established in all American cities and towns of appreciable size to make public library service more accessible to residents living in outlying areas who could not easily reach the main library. A branch library has, with a few exceptions,<sup>1</sup> been envisaged as a main library in miniature, offering the full range of services—on a more limited scale than the large, centrally located main library—to adults, young adults, and children within its service area. The aim has not been to make a branch as complete or self-sufficient as the main library, or to offer services as extensive or varied, but rather to make a range of library service conveniently available to all residents of the municipality.

Public library administrators are being compelled to re-examine their objectives and programs for providing library service to all because of the growth of suburbs and the decline of the central city, population shifts within cities, the need to promote library use by non-users, the increasing costs of providing library service, the increasing use of libraries by students, and the greater mobility of adults and young adults which has been made possible by the automobile and mass transportation facilities.

For purposes of this investigation, the author accepted the current thinking of the library profession with regard to public library objectives and services, as represented by the standards issued by the American Library Association in 1956.<sup>2</sup> While the objectives may be similar for all public libraries, it has been assumed that several different patterns of service may be used. It was the aim of this study to determine the most efficient schemes for providing adequate public library service to all residents of a typical large city. Adequate public library service requires a sufficient number of accessible library outlets that are open enough hours per week and have suitable physical facilities, adequate collections of books and other material, sufficient numbers of professional and nonprofessional staff to handle the workload, and a program of services designed to satisfy community needs.

To the area which a branch library serves, it not only represents, but is, the whole library system. Although a branch library in a typical city with more than 500,000 inhabitants cannot be expected to offer the persons who use it the large collections and specialized services of the main library, it is assumed that the branch can be expected to provide adequate public library service. For this study "adequate public library service" was defined as the level of service provided by the main library in independent cities and towns in Massachusetts serving populations between about 20,000 and 100,000 persons.

In spite of the fact that large book resources may be theoretically available to the users of all outlets in a large city library system, as well as to the patrons of smaller independent public libraries, through interlibrary loan service, it was assumed that adequate book collections should be on hand in local public library outlets when users visit the local units for service.

The branch library system of the city of Boston, Massachusetts, was used as the subject of the study because the Boston Public Library offered a network of branches that appeared to be representative of public library systems in cities with more than 500,000 inhabitants. Smaller municipal libraries in Massachusetts—especially those in Framingham, Lexington, Malden, and New Bedford—were used as cross-checks. In addition, two high school library collections were evaluated for the sake of comparison.

The 1960 decennial census reports that Boston, the thirteenth largest city in the United States, had a population of 697,197 inhabitants and a land area of 47.8 square miles, giving it an average of 14,586 persons per square mile.<sup>3</sup> The city of Boston may be thought of as divided into nine districts, as follows:

1. Boston Proper (including Back Bay, North End, South End, and West End) had a population of 109,761 inhabitants and a land area of about four square miles, giving it an average of approximately 27,440 persons per square mile.

2. Brighton had a population of 64,282 inhabitants and a land area of about five square miles, giving it an average of approximately 12,856 persons per square mile.

3. Charlestown had a population of 20,147 inhabitants and a land area of about one square mile.
4. Dorchester (including Ashmont, Codman Square, Columbia Point, Fields Corner, Lower Mills, Mattapan, Meetinghouse Hill, Mount Bowdoin, Neponset, Savin Hill, and Uphams Corner) had a population of 186,639 inhabitants and a land area of about nine square miles, giving it an average of approximately 20,738 persons per square mile.
5. East Boston had a population of 43,809 inhabitants and a land area of about six square miles, giving it an average of approximately 7,302 persons per square mile.
6. Hyde Park had a population of 33,123 inhabitants and a land area of about six square miles, giving it an average of approximately 5,521 persons per square mile.
7. Roxbury (including Eggleston Square, Grove Hall, Jamaica Plain, and Parker Hill) had a population of 120,290 inhabitants and a land area of about five square miles, giving it an average of approximately 24,058 persons per square mile.
8. South Boston had a population of 43,959 inhabitants and a land area of about three square miles, giving it an average of approximately 14,653 persons per square mile.
9. West Roxbury (including Roslindale) had a population of 66,795 inhabitants and a land area of about eight square miles, giving it an average of approximately 8,349 persons per square mile.

In addition, the 1960 decennial census reports that 7,463 persons lived on vessels in Boston Harbor and 1,812 persons on islands in the harbor belonging to Boston; these islands comprise in toto about one square mile of land area.<sup>4</sup>

The Boston Public Library was founded in 1852. Since the opening of the East Boston branch library in 1871, more than thirty outlets were added to the system.<sup>5</sup> During the period of this study, October, 1962, through September, 1963, the network of library outlets consisted of the central library at Copley Square in the Back Bay section of Boston Proper, twenty-six stationary branch libraries (two in Boston Proper, three in Brighton, one in Charlestown, seven in Dorchester, two in East Boston, one in Hyde Park, six in Roxbury, two in South Boston, and two in West Roxbury), and three bookmobiles—plus a small unit maintained at Boston City Hospital and a specialized business reference branch in the downtown commercial area, about one and one-quarter miles from Copley Square.

This study was almost exclusively concerned with the operation of the Division of Home Reading and Community Services of the Boston Public Library, which provides general library materials and services to satisfy the informational, educational, cultural, and recreational needs of all individuals and groups in the neighborhoods served by library outlets. Specialized library materials, information, and research services are provided by another division of the library, the Division of Reference and Research Services, which operates most of the public service departments in the central library as well as the business reference branch.

Regarding the smaller municipal libraries used as cross-checks, in 1960, Framingham Town Library served 44,526 persons residing in a land area of 24.1 square miles, or 1,848 persons per square mile;<sup>3</sup> four stationary outlets and a bookmobile were provided. Lexington, a town with a population of 27,691 inhabitants and a land area of 16.5 square miles, had a population density of 1,678 persons per square mile;<sup>3</sup> in addition to Cary Memorial Library, the main library, there is a branch library in East Lexington. The city of Malden had a population of 57,676 inhabitants and a land area of 4.8 square miles, giving it an average of 12,016 persons per square mile;<sup>3</sup> Malden Public Library maintains a main library and four stationary branches. New Bedford, a city with a population of 102,477 persons and a land area of 19.1 square miles, had a population density of 5,365 persons per square mile;<sup>3</sup> the Free Public Library of New Bedford provides service through a central library, three stationary branches, and a bookmobile.

The two high school library collections examined were in the following Massachusetts schools: Girls Latin School, Boston, a public school for academically superior girls in grades seven through twelve with an enrollment of 1,520 girls in September, 1962; and Newton South High School, Newton, a public co-educational school providing academic courses to about 1,600 students in grades ten through twelve in September, 1963.<sup>7</sup>

The feasibility of providing adequate library service to children and young adults through the coordination of school library service and public library service to children and young adults was not investigated. The socio-economic characteristics of library users were also generally ignored. Another matter not explored as part of this project was the possibility of adequate public library service being offered to residents of outlying areas of Boston through cooperative agreements involving the Boston Public Library and smaller independent public libraries in neighboring suburbs.

## CHAPTER I. HYPOTHESES AND RELATED MATTERS

In connection with determining the most efficient patterns for providing adequate public library service to all residents of a typical large city, in this case Boston, Massachusetts, several hypotheses were formulated for testing. The first hypothesis was that public library service outlets were not equally accessible to all residents of Boston—adults, young adults, and children. “Adults” were defined as persons nineteen years of age and older; “young adults” were defined as those from fourteen through eighteen years of age; and “children” were defined as those from five through thirteen years of age.

It was assumed that all Bostonians should have equal access to public library service in line with the democratic ideal of equal opportunity for all. “Accessibility” refers to the ease with which service of specified quality may be obtained, and is dependent upon the age of the user, among other factors. Although the distance traveled from one’s home to the library may be equal for a normal adult or young adult and a small child, the adult or young adult has greater access because (1) he can walk longer distances without tiring; (2) he can more easily use means of transportation other than his feet; (3) he does not require supervision while traveling; and (4) he can cope with traffic hazards and geographic barriers, such as highways, bridges, hills, railroad tracks, parks and industrial areas, more easily than a child can. Therefore, for effectively equal access in terms of distance, library service outlets for children must be provided at shorter intervals than library service outlets for adults and young adults.

What is the maximum distance that a small child could easily walk to reach a public library? There is no precise answer to this question because many variables—including the presence of traffic hazards and geographic barriers, the physical development, emotional maturity, and motivation of the child, and the policy of the community toward travel by small children—have to be considered. The presence of traffic hazards and geographic barriers reduces the distance that a child can walk with convenience and safety. The more physically developed, emotionally mature, and highly motivated a child is, the farther he can be expected to travel.

Communities differ in their policies toward travel by small children. Evidence of this may be seen in the pupil transportation laws of the various states. Although some states do not specify minimum distances that pupils must travel between their homes and schools to be entitled to free bus transportation, many states do; specified distances vary from five-eighths of a mile to four miles.<sup>1</sup> Stated in different terms, the maximum distances that children could walk (or have transportation provided by their parents) vary from five-eighths of a mile to four miles, depending upon the prevailing opinions in the different states. In Massachusetts, free transportation is mandatory when pupils have to walk two miles or more between homes and schools.<sup>2</sup>

Library service outlets for children are not quite comparable to schools because attendance in elementary schools is compulsory while visits to public libraries are generally voluntary. Nevertheless, the maximum distance that a small child is expected to walk to elementary school may serve as a guide to the maximum distance between homes or schools and library service outlets for children.

A search of library literature and educational literature reveals a variety of opinion among authorities concerning the maximum distance for young children to walk each way to and from school or the library. Three consultants on school construction—without referring to objective data—recommend half a mile as the maximum distance for elementary school pupils to walk to school.<sup>3</sup> While not citing empirical studies, the surveyors of extension service for youth at the Los Angeles Public Library suggest that half a mile be the maximum distance that youngsters travel from the school to the public library.<sup>4</sup> Similarly, Shaw’s study of libraries in metropolitan Toronto specifies half a mile as the maximum walking distance for a child in search of public library service, but no substantiating evidence is supplied.<sup>5</sup> A Wyoming school official’s doctoral thesis indicates that elementary school pupils in well-populated areas should not have to walk more than three-quarters of a mile one way to school,

but objective data are not cited.<sup>6</sup> Finally, McColvin offers his opinion that children's libraries should be "certainly not more than a mile from their homes or their schools and preferably less."<sup>7</sup>

On the basis of whatever authoritative opinions were available, the assumption was made for purposes of this study that the maximum walking distance for a small child should be half a mile; therefore, a library more than half a mile from a child's home or school would be effectively inaccessible in terms of distance.

What is the maximum distance that an adult or young adult could easily travel to reach a library? As in the case of a small child, there is no pat answer because of many factors that have to be considered; however, some empirical studies have been made. In 1933, Horwitz reported that a survey of patrons of the Duluth Public Library revealed that a branch library in the main section of the city attracts mostly persons living within a half mile radius of the branch, a branch library in an isolated suburb draws well for a distance of three-quarters of a mile, and "the main library building, because of its central location, longer hours of service, greater book selection, and superior service, attracts city-wide patronage, but residents beyond a radius of two miles use it infrequently."<sup>8</sup> Wert's 1937 paper on the relative effectiveness of two branch libraries in St. Louis indicates that half a mile is the maximum distance most adults are willing to travel to reach a branch.<sup>9</sup> Finally, an investigation by Blackburn in 1948 involving two similar branches of the New York Public Library, one large and the other small, shows that adults are generally willing to travel one and one-half miles to obtain superior library service in a large branch, but only three-quarters of a mile to obtain service in a small branch; this statement is true mainly with respect to male patrons, since female patrons tend to travel no more than three-quarters of a mile.<sup>10</sup>

On the basis of the objective data available, it was assumed that one and one-half to two miles should be the maximum distance for an adult or young adult to travel to obtain library service. For effectively equal access, there would have to be a public library outlet located within one and one-half to two miles of every adult's or young adult's home and within half a mile of every child's home.

The second hypothesis was that adequate public library service was not available to all residents of Boston, even if outlets were equally accessible to all. As defined earlier (see "Introduction") "adequate public library service" referred to the level of service provided by the main library in independent cities and towns in Massachusetts serving populations between about 20,000 and 100,000 persons. This population range was selected because it corresponded roughly to the range of populations within the nine districts of Boston.<sup>11</sup> It was assumed that a branch library should provide the same level of service as the main library in a small municipality serving the same number of people. Furthermore, the assumption was made that most adults and young adults use public library outlets no more than two miles from their homes while most children use outlets no more than half a mile from their homes.

A third hypothesis was that a high school library with a stock of materials that met established standards<sup>12</sup> provided collections that were superior in quality to the adult and young adult collections of a typical branch library in Boston.

An attempt was made to determine if—in place of the present branch library system—a network consisting possibly of seven large library service outlets (hereafter referred to as "regional libraries"), each serving a population of about 100,000 persons (one-seventh of Boston's 1960 inhabitants) residing within a land area of about seven square miles (approximately one-seventh of Boston's land area)—plus many small library service outlets (hereafter referred to as "neighborhood libraries"), each serving primarily children residing within land areas of less than one square mile that are part of the larger areas served by regional libraries—would result in (1) all Bostonians having effectively equal access to adequate public library service, and (2) better utilization of staff than is possible with the present branch library system. With a regional library system for Boston, each regional library would, in effect, be the main library for a region—with neighborhood libraries serving most of the functions of branch libraries in the present system. It was assumed that the Boston Public Library would continue supplying library service to elementary school pupils, even in the event that school libraries—which are presently lacking in Boston—were established.

Finally, an attempt was made to determine if the costs of establishing and maintaining a regional library system for Boston designed to provide adequate public library service to all residents would be less than the costs of establishing and maintaining a conventional branch library system designed to provide an equivalent level of service.

## CHAPTER II. METHODOLOGY

Before the most efficient patterns for providing adequate public library service to all residents of a typical large city such as Boston, Massachusetts, could be determined, the present levels of service and the extent of use of existing library service had to be evaluated.

Measures of accessibility include the distance that the user must travel to obtain service, the travel time, and the number of hours per week that the service agency is open to the public. In this study, accessibility was measured by determining the distances between stationary outlets, both in terms of miles and in terms of travel time by public transit facilities and on foot, and the extent to which outlets were distributed throughout the city of Boston. Bookmobile stops were not included because bookmobiles can provide few adult services other than book distribution.<sup>1</sup>

As discussed earlier, a public library outlet should be located within one and one-half to two miles of every adult's or young adult's home and within half a mile of every child's home to provide effectively equal access to all Bostonians. In terms of travel time, it seems reasonable that no adult or young adult should have to travel more than twenty minutes by public transportation—including waiting time—and no child should have to walk more than twenty minutes to obtain adequate public library service.

Statistics on hours of service per week were gathered for all public library outlets in Boston. These were compared with statistics for all independent libraries in Massachusetts serving populations of 20,000 to 100,000 persons—populations roughly comparable in size to those of Boston's nine districts.

To determine the adequacy of physical facilities, data on the age, ownership, physical condition, and layout of buildings housing branch libraries, and on the floor space, meeting rooms, seating capacities of reading areas and meeting rooms, audio-visual equipment, bulletin boards, and display areas, were gathered and evaluated in line with the following criteria:

1. Branch libraries should be housed in attractive, well-lighted buildings not more than thirty years old.
2. All public service areas should be grouped on one floor so that effective control can be maintained from a single service point, if possible.
3. There should be sufficient space for materials, patrons, and staff.
4. There should be meeting rooms for group services.
5. Audio-visual equipment should be available so that recordings, films, and other non-book materials may be examined by individuals and groups.
6. There should be bulletin boards and display areas to serve as vehicles for publicity.

The adequacy of collections was measured by quantitative and qualitative means. The size of branch collections was compared to the size of collections in the libraries of all independent municipalities in Massachusetts ranging in size from 20,000 to 100,000 population. It was assumed that communities with populations of comparable size should have accessible to them library collections of comparable size.

In order to analyze branch library service on a per capita basis, it was necessary to estimate the populations served by the various branches. Registration statistics for the entire system were of no value because they were not divided by outlet; besides, not all potential users were registered borrowers. Populations served by branches were estimated from statistics gathered during the 1960 decennial census for census tracts in Boston.<sup>2</sup> The assumptions underlying the estimating procedures were:

1. Significant changes had not occurred in the size and distribution of Boston's population since 1960.
2. Within census tracts, population was evenly dispersed so that dividing a tract geographically resulted in equal populations inhabiting equal parts of the tract.

3. People used only the library outlets closest to their homes, unless topographic factors necessitated the use of the next nearest outlets.

4. Bookmobile stops were not counted, all inhabitants of Boston—except for the 9,275 persons residing on vessels and islands in Boston Harbor—being assigned to a stationary outlet.

Branch book collections were compared quantitatively on absolute and per capita bases with collections in all independent Massachusetts public libraries serving populations of 20,000 to 100,000 persons. The budgets for the purchase of books and periodicals were also analyzed.

The quality of book and periodical collections was evaluated with the use of specially developed checklists. The assumption was made that all adequate library collections, regardless of the differences among the communities served, should include certain standard titles that had been highly recommended by several established authorities. The checklists of books that were used in this study consisted only of items that had been chosen as highly desirable for basic collections by at least two nationally respected compilers of book selection tools. It was known that these lists were not perfect instruments, but they represented what was thought to be the consensus of professional opinion. Although there could not be complete agreement on checklists, the same lists were used in evaluating branch collections, collections in the main public libraries at Boston, Framingham, Lexington, Malden, and New Bedford, and collections in the two high school libraries; therefore, the results obtained were comparable.

No titles published after December 31, 1961, appeared on the checklists so that all libraries checked would have had an opportunity to acquire the items and add them to their collections before the checking, which was carried on during 1963. Although a separate list was compiled for checking children's collections, separate lists were not prepared for adult and young adult titles because of the great extent of duplication; approximately 80 percent of the titles in a young adult collection should be adult books, according to established standards.<sup>3</sup>

The checklist of five hundred children's titles contained both fiction and nonfiction which appeared on at least two of the following bibliographies: Children's Catalog, 10th edition (New York, H. W. Wilson, 1961), plus the 1962 supplement (double-starred titles only); 3300 Best Books for Children, 1962 edition (see below); Mary K. Eakin's Good Books for Children . . ., (revised and enlarged edition, Chicago, University of Chicago Press, 1962); and Hilary J. Deason's The Science Book List for Children, (Washington, D. C., American Association for the Advancement of Science, 1960 [double-starred titles only]). There was a double stress, in the instrument which was developed, upon books included in the Children's Catalog, since Catalog of 3300 of the Best Books for Children . . . (New York, R. R. Bowker, 1962) was largely based upon the Wilson Company publication; this duplication was considered desirable.

Initially, 947 titles were obtained through a comparison of the foregoing standard lists—about 340 from checking the double-starred titles in the Children's Catalog against 3300 Best Books, about ten additional titles from matching Good Books with the Children's Catalog, about 550 more from a comparison of 3300 Best Books with Good Books, and an additional forty-five by introducing the double-starred titles from Science Book List to the compilation; the latter specialized list was included because of the weakness of the general standard lists in the area of science. The 947 titles were reduced in number to 500 by the use of a table of random digits after they were arranged in alphabetical order by author and assigned numbers ranging from 001 for Adler's Dust to 947 for Zolotow's Storm Book.

Only in cases where there was agreement among any two of the bibliographies concerning the edition of a title was the given title acceptable for the checklist; when more than one edition was acceptable, only the latest one was included. If no two bibliographies agreed upon a particular edition of a title, the title was omitted. In the case of items undergoing continuous revision, such as encyclopedias, editions published between 1958 and 1961 were acceptable because it was assumed that they are out of date within five years; to include only 1961 editions of such items on the checklist was considered unfair to the libraries being studied. Because 3300 Best Books and Good Books included books for the young adult of high school age, as well as the child, there were fourteen titles among the 500 on the checklist that duplicated titles on the lists for adults and young adults before the titles were deleted from the latter lists.

Since the user of a library is generally granted permission to obtain books from any collection—adult, young adult, or children's—when the need arises, it was assumed that there need not necessarily be three copies of a book such as Verne's Twenty Thousand Leagues Under the Sea found in each of the libraries; consequently, a given title appeared only on one of the checklists, unless there

was a special edition of it recommended for a given age group. The collections in a library were treated as a unit during the application of the checklists.

A checklist of adult and young adult fiction was compiled from double-starred titles in the Fiction Catalog, 7th edition, (New York, H. W. Wilson Co., 1960) plus the 1961 supplement, and in the Basic List of Adult Books for Branches of the D. C. Public Library, (Washington, D. C., Public Library, 1960); 3000 Books for Secondary School Libraries, (New York, R. R. Bowker, 1961); and annual listings of "Notable Books"<sup>4</sup> and "Interesting Adult Books for Young People"<sup>5</sup> for 1961, both prepared by committees of the ALA. The instrument which was developed placed more emphasis upon adult titles than upon books for young adults.

Matching of double-starred titles from the Fiction Catalog and the D. C. Public Library list yielded 172 titles for the checklist; eighty-five more titles were added by comparing the fiction titles in 3000 Books with the double-starred entries in the Fiction Catalog and the D. C. Public Library list; introducing the other two listings supplied eight more titles. Of the 265 titles appearing on at least two lists, eight were deleted from the final adult and young adult fiction checklist because they appeared on the checklist of children's books.

As with children's books, only in cases where there was agreement among at least two bibliographies concerning the edition of a title was the given title acceptable for the fiction checklist. In cases where one bibliography listed an anthology and another listed each of the parts of the anthology as separate works, the anthology title was acceptable, and the separate parts were indicated along with the anthology title so that libraries holding the individual parts but lacking the anthology were given credit during the checking.

An adult and young adult nonfiction checklist was developed from double-starred items in the Standard Catalog for Public Libraries, 4th edition, 1958 (plus the supplements for 1959-61); double-starred items in the Basic List of Adult Books for Branches of the D. C. Public Library, 1960; 3000 Books for Secondary School Libraries, 1961; New York Public Library's Basic List for Branch Reference Collections, 2nd edition, 1960; double-starred titles in Hilary J. Deason's AAAS Science Book List, (Washington, D. C., American Association for the Advancement of Science, 1959); and annual listings for 1961 of "Notable Books" and "Interesting Adult Books for Young People" and "Reference Books"<sup>4</sup> and "Technical Books,"<sup>5</sup> published in Library Journal.

Matching of double-starred entries in the Standard Catalog (New York, H. W. Wilson Co., 1928) and the D. C. Public Library list supplied about three hundred titles; checking 3000 Books against the Standard Catalog and the D. C. Public Library list added another two hundred and eighty items; using the New York Public Library's reference list for branches as a cross-check yielded about a hundred more titles; similarly, the AAAS list added about forty items; and another forty were contributed through comparing titles on the remaining lists. In all, 757 nonfiction titles were obtained in this manner; six of these were eliminated because of their inclusion on the checklist of children's books.

The same guidelines were followed in the compilation of this list as were adhered to in the preparation of the two previous lists; in addition, in the case of a yearbook, only the 1961 edition was accepted, unless it was considered important that a ten-year file be held. When the 751 items on the checklist of adult and young adult nonfiction were arranged according to the Dewey decimal classification, the distribution shown in Table 1 was found. The disproportionately large number of 900's resulted from the inclusion of many guides to individual states prepared by the Federal Writers Project. If the specialized reference and science bibliographies had not been used in conjunction with the general lists, the proportion of science and technology books on the checklist would have been smaller. No differentiation was made between reference and non-reference items because many items could, with justification, be placed in either category.

As an instrument for checking on the quality of periodical collections, the list of 128 periodicals indexed by the Reader's Guide to Periodical Literature during the spring of 1963 was used.

A union shelflist, against which the three checklists of books could be matched, was available. For those units in the Boston Public Library which were part of the Division of Home Reading and Community Services, including the twenty-six branch libraries, the bookmobiles, and the Open Shelf, Branch Issue, and Audio-Visual Departments in the central library. It should be noted, however, that the union shelflist was not completely accurate in two respects: (1) in some cases, items which had been discarded still were listed as being held; and (2) in many cases, no differentiation was made between editions held. Because of these factors, during the checking units were sometimes given credit for holding items which were not part of their collections. The possibility of units possessing titles not included in the union shelflist was small, according to the department chief responsible for the maintenance of the records.<sup>8</sup>

TABLE 1  
DISTRIBUTION OF ITEMS ON CHECKLIST OF ADULT AND YOUNG ADULT NONFICTION  
TITLES BY DEWEY DECIMAL CLASSIFICATION

Class	Number of Titles in Class	Titles in Class as Percentage of Total
000	36	4.8
100	17	2.3
200	42	5.6
300	79	10.5
400	25	3.3
500	81	10.8
600	45	6.0
700	51	6.8
800	121	16.1
900	176	23.4
Biography	78	10.4
Total	751	100.0

The main public catalog, which listed titles in the Division of Reference and Research Services, was checked for items not found in the union shelflist. Additional searching was done in departmental catalogs in cases where the main public catalog was deficient.

Files in the Book Purchasing Department of the Boston Public Library were checked in the case of the periodicals list. Units were given credit for titles received on subscription as of July, 1963.

The checklists of materials were also matched against the holdings of the main libraries in four typical Massachusetts municipalities ranging in size from about 20,000 to 100,000 population and of two high school libraries. This was done in conjunction with visits to the libraries and interviews with staff during the summer and fall of 1963.

A checklist of reader services was developed to assess the range of services provided; this provided one measure of quality. This checklist was applied in conjunction with interviews with staff and observations in all outlets of the Boston Public Library and in the independent municipal libraries chosen. It was assumed that the checklist included all reader services provided by public libraries in the United States. The list was based upon the American Library Association's 1956 standards for public libraries, Public Library Service, A Guide to Evaluation, with Minimum Standards (Chicago, ALA, 1956); New York Public Library's Use of the Circulation Department: Policies and Procedures; (1960); Margaret E. Monroe's checklist of services developed for courses in reader services offered at the Graduate School of Library Service at Rutgers, and the list from Helen L. Smith's Adult Education Activities in Public Libraries; a Report of the ALA Survey of Adult Education Activities in Public Libraries and State Library Extension Agencies of the United States (Chicago, ALA, 1954). The checklist of services was divided into four parts: (1) physical plant and arrangement of materials; (2) orientation and instruction in use of the library; (3) reader's assistance; and (4) group services. Quantitative measures were included where applicable.

Before use patterns could be studied, it was necessary to determine what was meant by "library use." "Library use" could be defined in several quantitative ways.

If, by "library use," one is referring to the number of persons occupying the public service areas in a library, attendance data may furnish this information. Many persons, however, use the library as a substitute for a social center and do not seek the types of materials and services that a library provides.

If, by "library use," one means the amount of reading done, circulation statistics may furnish this information. But many books are read in the library and do not circulate. In addition, many of the books borrowed may not be read by the borrower, his family, or his friends. Therefore, the circulation figures reflect accurately only the activity at the charging desk.

If, by "library use," one is referring to the amount of information and reading guidance provided to patrons by librarians, a count of questions asked may furnish this information. Many questions, however, do not relate to library materials or services or are simply directional; the inclusion of directional questions in a count of reference and advisory requests makes it appear as though there was more professional work than actually was the case.

In spite of their shortcomings, attendance data, circulation figures, and reference statistics relating to branch libraries in Boston were analyzed as part of this study. Circulation figures for other Massachusetts libraries were available, but attendance and reference statistics were not.

A survey of attendance was conducted by the Division of Home Reading and Community Services in each of the twenty-six branch libraries between October 15 and October 31 (in the case of all branches except the East Boston branch, which terminated the study on October 27, and three other branches, which collected data through November 3), 1962. The number of patrons and staff present every hour on the half-hour during what was assumed to be a representative period was recorded; it was thought that the hourly spot checks reflected the total attendance picture. In addition, the daily circulation figures during the period were noted on a data sheet (see Appendix II). The attendance data obtained were compared on a day-by-day and hour-by-hour basis. During the same period, the number of individual requests for information and reading guidance were recorded daily on a form (see Appendix III) developed by the Division of Home Reading and Community Services; these data were not broken down by hours of the day, but were divided according to age groups—adults, young adults, and children.

For two branches, attendance figures were separated by public service areas—i.e., adult area, young adult area, and children's area—as were requests for information and reading guidance in all branches. At two other branches, attendance figures were divided into two groups: adult and young adult, and children. The fact that there were separate charging machines on each floor in three of the four two-floor branches made it possible for them to separate circulation data for adults and young adults from children; in none of the other units were circulation figures divided by age groups. The assumption was made that patrons used principally the public service areas designated for their use, by age groups.

In addition to the analysis of data on library use supplied by the Division of Home Reading and Community Services, on-the-spot observations and interviews with staff were conducted in all branch libraries, primarily in the spring of 1963, to determine the extent of use. In addition to some brief visits, each branch library was observed for a whole day (from 9 a.m. to either 6 p.m. or 9 p.m.) during each full visit, weather conditions were described, attendance by patrons and staff was noted every hour on the half-hour, jobs being performed by all bibliothecal staff were recorded several times per hour, users and use patterns were described periodically, and total circulation statistics for the day were collected. It was assumed that sample observations would help in the evaluation of the total picture and act as a check on the reliability of data obtained during the October, 1962, study period. It was ascertained through interviews that, among branch librarians, the methods of data collection were not uniform. A comparison of attendance and circulation data collected during the study period with those collected during the on-the-spot observations revealed that, although in some branches circulation was about the same, attendance had fallen during the study period; this leads one to suspect that some attendance figures during the study period were actually lower than reported.

Annual circulation statistics from the Boston Public Library and all independent public libraries in Massachusetts serving populations of between 20,000 and 100,000 persons were analyzed and compared on a per capita basis.

At the time of this study, units of the Boston Public Library did not systematically collect circulation data according to the age groups of borrowers. Circulation statistics by age groups were therefore obtained by counting the number of items circulated on each of the three types of borrower's cards during what were considered to be representative periods: July 25-30, 1960, January 23-28, 1961, April 24-29, 1961, July 22-27, 1962, January 21-26, 1963, and April 22-27, 1963; because of blurred film records, equivalent weeks were substituted in some cases. These reports on circulation by age groups, prepared by the Division of Home Reading and Community Services, are shown in Appendix IV. Although the type of borrower's card used did not necessarily indicate the age group of the borrower (for example, all members of a family might have used the same card), it was assumed that the type of borrower's card used was a rough measure of the age group of the borrower.

During National Library Week, April 8-14, 1962, Bostonians visiting their local branch libraries were asked to fill out a "Library-User Questionnaire," which did not have to be signed and which consisted largely of multiple-choice questions. The purpose of the form which was for adults only, was to indicate the needs and interests of users of the branch libraries, so that better service might be provided. Because these questionnaires were not distributed to the public in a random manner, generalizing from the responses obtained was not possible. Nevertheless, the completed questionnaires were analyzed to shed some light on the question of library use.

During the period from January 19 to February 8, 1959, the Boston Public Library surveyed the people entering the central library at Copley Square and the Kirstein business branch to determine the

extent of nonresident use of the Division of Reference and Research Services. A random sample of the users was not obtained in this case either, because there were many people who completed more than one questionnaire. The results of the survey were nevertheless incorporated into this study of the Boston library system.

To determine if staff were being utilized effectively in Boston's branch libraries, data on staffing patterns were assembled. An analysis was made of the allocation of staff in professional and non-professional categories in branches. The ratio of circulation to staff size was computed, and comparisons were made with what were assumed to be appropriate standards from recognized authorities.

During observations made in branches during the spring of 1963, the tasks performed by all staff members (excluding maintenance personnel) were recorded and later analyzed in terms of professional and nonprofessional duties. In differentiating between professional and nonprofessional tasks, the list of duties issued by the American Library Association in 1948 was referred to extensively. "Professional duties" were defined as "those whose adequate performance involves the ability to exercise independent judgment based upon an understanding of the elements of library service—books, readers, and the means by which they are brought into effective relationship—and in addition a familiarity with specific library techniques and procedures."<sup>9</sup>

"Nonprofessional duties" were defined as those that nonprofessional employees were able to perform satisfactorily, without the professional training and/or experience of professional employees. In spite of the fact that professional employees were observed performing many tasks satisfactorily, these tasks were not considered professional in nature if a nonprofessional employee was observed performing the same tasks adequately. It was conceded by the authors of the 1948 list that "many individual library duties classed as 'professional' can be performed, after training in specific techniques, by 'nonprofessional' library employees."<sup>5</sup> Nonprofessional employees in the bibliothecal service of the Boston Public Library were either library aides (part-time employees, usually attending school or college on a full-time basis) or library assistants (full-time employees, usually lacking college education); professional employees included both those in the professional library service and those in the preprofessional library service, for those in the latter group were given the same assignments as those on the lowest levels of the former group. The assumption was made that the sample observations were indicative of the normal staffing patterns and work assignments.

The costs of present branch library service in Boston were analyzed in absolute terms and on a per capita basis. The cost per circulation was computed for branch libraries in Boston and for all independent public libraries in Massachusetts serving between 20,000 and 100,000 persons. Comparisons were made to determine which libraries were operated more efficiently.

On the basis of the information gathered, a few possible approaches to the problem of providing adequate public library service to all residents of Boston were proposed. The number and size of possible library outlets, together with the estimated costs involved, were presented. Underlying the proposals was the conviction that all Bostonians were entitled to the same level of library service which they would have received as residents of small cities and towns, rather than of neighborhoods in a city with nearly 700,000 inhabitants.

CHAPTER III. THE ADEQUACY OF BRANCH LIBRARIES IN BOSTON IN TERMS OF PHYSICAL FACILITIES

The services that a library can provide are limited by the physical facilities of the unit. As Table 2 indicates, four of the twenty-six branch libraries in Boston in 1963 were housed in buildings constructed in the nineteenth century; the oldest of these branches was moved to a new building in 1964. Only five of the structures housing branches were erected after 1933; therefore, twenty-one, or 80 percent, of the branches were buildings constructed over thirty years earlier.

TABLE 2  
CONSTRUCTION DATES, AND OWNERS OF BUILDINGS HOUSING  
BRANCHES OF THE BOSTON PUBLIC LIBRARY IN 1963\*

Branch Library	Construction Date	Owner	Rental Charge (1961)
Adams Street	1952	Library	
Allston	1927	Private	\$4,000
Brighton	1874	Library	
Charlestown	1913	Library

Uphams Corner	1904	City	
Washington Village	1941	City	\$ 101
West Roxbury	1922	Library	

\*Data from Division of Home Reading and Community Services, Boston Public Library

Of the twenty-six branches, sixteen were housed in buildings owned by the Boston Public Library, as Table 2 shows; seven occupied parts of buildings under the jurisdiction of other city departments; and three were housed in quarters rented from private realtors. Four of the seven branches occupying parts of city-owned buildings were housed in regular municipal buildings together with other city departments; the fifth occupied part of a police station; the sixth was housed in Boston Technical High School; and the seventh was quartered in the basement of an apartment house in a public housing project. A token rental charge of \$101 was paid annually for space in the housing project. In 1961,

the rental charges paid to private realtors for space for branch libraries amounted to \$12,471—\$3,600 for a store-type location, \$4,000 for a second-floor loft in a commercial office building, and \$4,871 for a one-story building devoted exclusively to library purposes.

In four of the twenty-six branches, public service areas (excluding meeting rooms) were provided on two floors, as Table 3, indicates; one of these two-floor branches was moved to the new one-story building mentioned earlier. One-story outlets are less costly to staff than two-floor units when public service areas (excluding meeting rooms) are provided on both levels, assuming that the branches have equivalent workloads and that supervision can be maintained from the same number of control points on a floor in both instances.

TABLE 3  
FLOOR SPACE IN BRANCH LIBRARIES OF THE BOSTON PUBLIC LIBRARY IN 1963\*

Branch Library	No. of Floors with Public Service Areas <sup>a</sup>	Floor Space (in Square Feet) <sup>b</sup>	Estimated Population Served (1960)	Floor Space per Capita (in Square Feet)
Adams Street	1	6,301	21,615	.29

Median		6,592	24,001	.29

<sup>a</sup>Excludes meeting rooms if they are on additional floors—as was the case at Brighton, Charlestown, Connolly, East Boston, Hyde Park, Jamaica Plain, Parker Hill, and West Roxbury branch libraries.

<sup>b</sup>Includes meeting rooms, maintenance areas, etc. on all floors.

\*Data from Division of Home Reading and Community Services, Boston Public Library

As Table 3 shows, the branches of the Boston Public Library in 1963 had floor areas varying from 2,175 square feet to 14,924 square feet, with a median of 6,592 square feet. Considering the populations served by the various branches in 1960, the floor space per capita varies from .08 square feet to 1.15 square feet, with a median of .29 square feet.

Table 4 depicts the seating situation in Boston's twenty-six branch libraries in 1963. Ten of the branches did not differentiate between adults and young adults with regard to seating, as visits to

branches in the spring of 1963 revealed. The number of seats provided in public service areas (excluding meeting rooms) for adults and young adults varied from 13 to 100, with a median of 47; in children's areas, the median number of seats was 38.5, with the range extending from 12 to 83; for all public service areas combined (excluding meeting rooms), the number of seating accommodations ranged from 29 to 183, with a median of 84. Considering the population served by the various branches in 1960, the number of seats per thousand population varied from 1.7 to 7, with a median of 3.6.

In addition to the normal public service areas and staff areas, ten branch libraries in Boston had been given special meeting rooms in which group services might be provided; the seating capacities of the special rooms are shown in Table 5. When other branches present group programs, meetings are held in what are normally public service areas or staff rooms. As a result, group services interfere with the provision of services to individuals in branches lacking special meeting rooms.

As Table 5 shows, seventeen of the twenty-six branch libraries had operable record players in the spring of 1963 while five had motion picture projection equipment. It was possible for all branches to borrow projection equipment and projectionists from the central library, but record players were not lent.

The distribution of display areas and of bulletin boards in the various branches is also depicted in Table 5. All except two branches had some areas set aside for displays or exhibits. Only one branch lacked a bulletin board.

TABLE 5

## DISTRIBUTION OF MEETING ROOMS, RECORD PLAYERS, PROJECTION EQUIPMENT, DISPLAY AREAS, AND BULLETIN BOARDS IN BRANCHES OF THE BOSTON PUBLIC LIBRARY, 1963

Branch Library	Seating Capacity of Meeting Room	Operable Record Player	Projection Equipment	No. of Display Areas	No. of Bulletin Boards

For the sake of comparison, data on physical facilities gathered in the main public libraries at Framingham, Lexington, Malden, and New Bedford, Massachusetts, are shown in Table 6. Although these cities and towns varied in population from 27,691 to 102,477 persons in 1960, while the branches in Boston served populations estimated at from 11,970 to 36,289 persons, the total public seating capacities of the main libraries (excluding meeting rooms) ranged only from 111 to 144, with a median of 125.5, while the range for the branches extended from 29 to 183, with a median of 84. The main libraries in the small municipalities had from 77 to 117 seats for adults and young adults (excluding meeting rooms), with a median of 93, or 46 more than the median number of adult and young adult seats in branches. For children, the main libraries provided between 18 and 42 seats, with a median of 33, while Boston's branches provided a median of 38.5 seats, or 5.5 more than the main libraries.

While two of the four main libraries in small cities and towns had large meeting rooms, three had record players, and all had motion picture projection equipment, display areas, and bulletin boards. In addition, three of the four main libraries had a machine for photoduplication of library materials, an item lacking in all branch libraries in 1963.

Supervision of all public service areas (excluding meeting rooms) from a central control point was possible in all branch libraries in Boston in 1963, except for the four with two floors and at least five other units with poorly designed physical layouts—Brighton, Faneuil, Hyde Park, Lower Mills, and Washington Village branches. At the Brighton branch, the young adult and children's areas could not be observed from the circulation desk. The children's room at Faneuil branch, which was formerly a meeting room, was separated from the rest of the library by a long, narrow hallway. Hyde Park branch had a stack area which could not be supervised from the circulation desk and a children's room and a reference area which could not be observed from the charging desk. Lower Mills branch library

TABLE 6

DISTRIBUTION OF SEATS, MEETING ROOMS, RECORD PLAYERS, PROJECTION EQUIPMENT,  
 DISPLAY AREAS, BULLETIN BOARDS, AND PHOTODUPLICATION EQUIPMENT IN  
 THE MAIN PUBLIC LIBRARIES OF FOUR INDEPENDENT MUNICIPALITIES  
 IN MASSACHUSETTS IN THE SUMMER OF 1963

Municipality	Population (1960)	No. of Adult and Young Adult Seats <sup>a</sup>	No. of Children's Seats <sup>a</sup>	Total No. of Seats <sup>a</sup>	No. of Seats in Meeting Room
Framingham	44,526	84	32	116	--- <sup>b</sup>
Lexington	27,691	102	42	144	---
Malden	57,676	77	34	111	100
New Bedford	102,477	117	18	135	250

Municipality	Record Player?	Projection Equipment?	No. of Display Areas	No. of Bulletin Boards	Photo- duplication Equipment?
Framingham	Yes	Yes	4	4	No
Lexington	Yes	Yes	14	17	Yes
Malden	Yes	Yes	12	5	Yes
New Bedford	No	Yes	5	5	Yes

<sup>a</sup>Excluding seats in meeting rooms. Because there were other stationary outlets in the independent municipalities for which data were not available, an analysis of seating accommodations on a per capita basis was not attempted.

<sup>b</sup>Meeting room to be set up in unfinished basement of building.

was a maze of small rooms in a building that was formerly a city jail. Finally, Washington Village branch occupied a large basement room shaped like the letter U; as a result, complete supervision from a central point was not possible.

#### CHAPTER IV. THE ACCESSIBILITY OF PUBLIC LIBRARY SERVICE IN BOSTON

In 1963 the city of Boston was served by the central library, twenty-six regular branch libraries, a small library at Boston City Hospital, the Kirstein business branch, and three bookmobiles which made weekly stops at seventy locations, each visit lasting no longer than two and one-half hours.

The locations of the twenty-six regular branches and the central library (as shown in Fig. 1) are as follows:

1. Adams Street branch—Adams Street and Pierce Avenue (Dorchester)
2. Allston branch—Harvard Avenue and Glenville Terrace (Brighton)
3. Brighton branch—Academy Hill Road and Parkland Street (Brighton)
4. Charlestown branch—Monument Square (Charlestown)
5. Codman Square branch—Codman Square (Dorchester)
6. Connolly branch—Centre Street and South Huntington Avenue (Roxbury)
7. Dorchester branch—Adams and Arcadia Streets (Dorchester)
8. East Boston branch—Meridian and Lexington Streets (East Boston)
9. Egleston Square branch—Columbus and Walnut Avenues (Roxbury)
10. Faneuil branch—Oak Square (Brighton)
11. Hyde Park branch—Harvard Avenue and Winthrop Street (Hyde Park)
12. Jamaica Plain branch—South and Sedgwick Streets (Roxbury)
13. Lower Mills branch—Washington and Richmond Streets (Dorchester)
14. Mattapan branch—Blue Hill Avenue and Hazelton Street (Dorchester)
15. Memorial branch—Warren and Townsend Streets (Roxbury)
16. Mount Bowdoin branch—Washington and Norwell Streets (Dorchester)
17. Mount Pleasant branch—Dudley and Vine Streets (Roxbury)
18. North End branch—Hanover and North Bennet Streets (Boston Proper)
19. Orient Heights branch—Barnes Avenue and Saratoga Street (East Boston)
20. Parker Hill branch—Tremont and Burney Streets (Roxbury)
21. Roslindale branch—Roslindale Square (West Roxbury)
22. South Boston branch—East Broadway and I Street (South Boston)
23. South End branch—Blackstone Square (Boston Proper)
24. Uphams Corner branch—Columbia Road and Bird Street (Dorchester)
25. Washington Village branch—Old Colony Avenue and Vinton Street (South Boston)
26. West Roxbury branch—Centre and Bellevue Streets (West Roxbury)
27. Central library—Copley Square (Boston Proper)

Each of the nine districts of Boston had at least one regular branch library. In addition to the central library building, there were two regular branches in Boston Proper; Brighton had three branches; Charlestown had one branch; Dorchester had seven branches; East Boston had two branches; Hyde Park had one branch; Roxbury had six branches; South Boston had two branches; and West Roxbury had two branches.

Excluding the limited hospital library service, the specialized business reference service, and the bookmobile stops, there were twenty-seven library outlets in 1963, scattered throughout Boston's 47.8 square miles, or an average of one unit for each 1.8 square miles of land area. If these twenty-seven units had been provided at equal geographical intervals, no Bostonian would have had to travel more than three-quarters of a mile, as the crow flies,\* to reach a library. As Fig. 1 indicates, however, the branches were not evenly distributed throughout the city. In Boston Proper, there was roughly an

---

\*All distances given are "as the crow flies," rather than the distances actually traveled by existent roads.

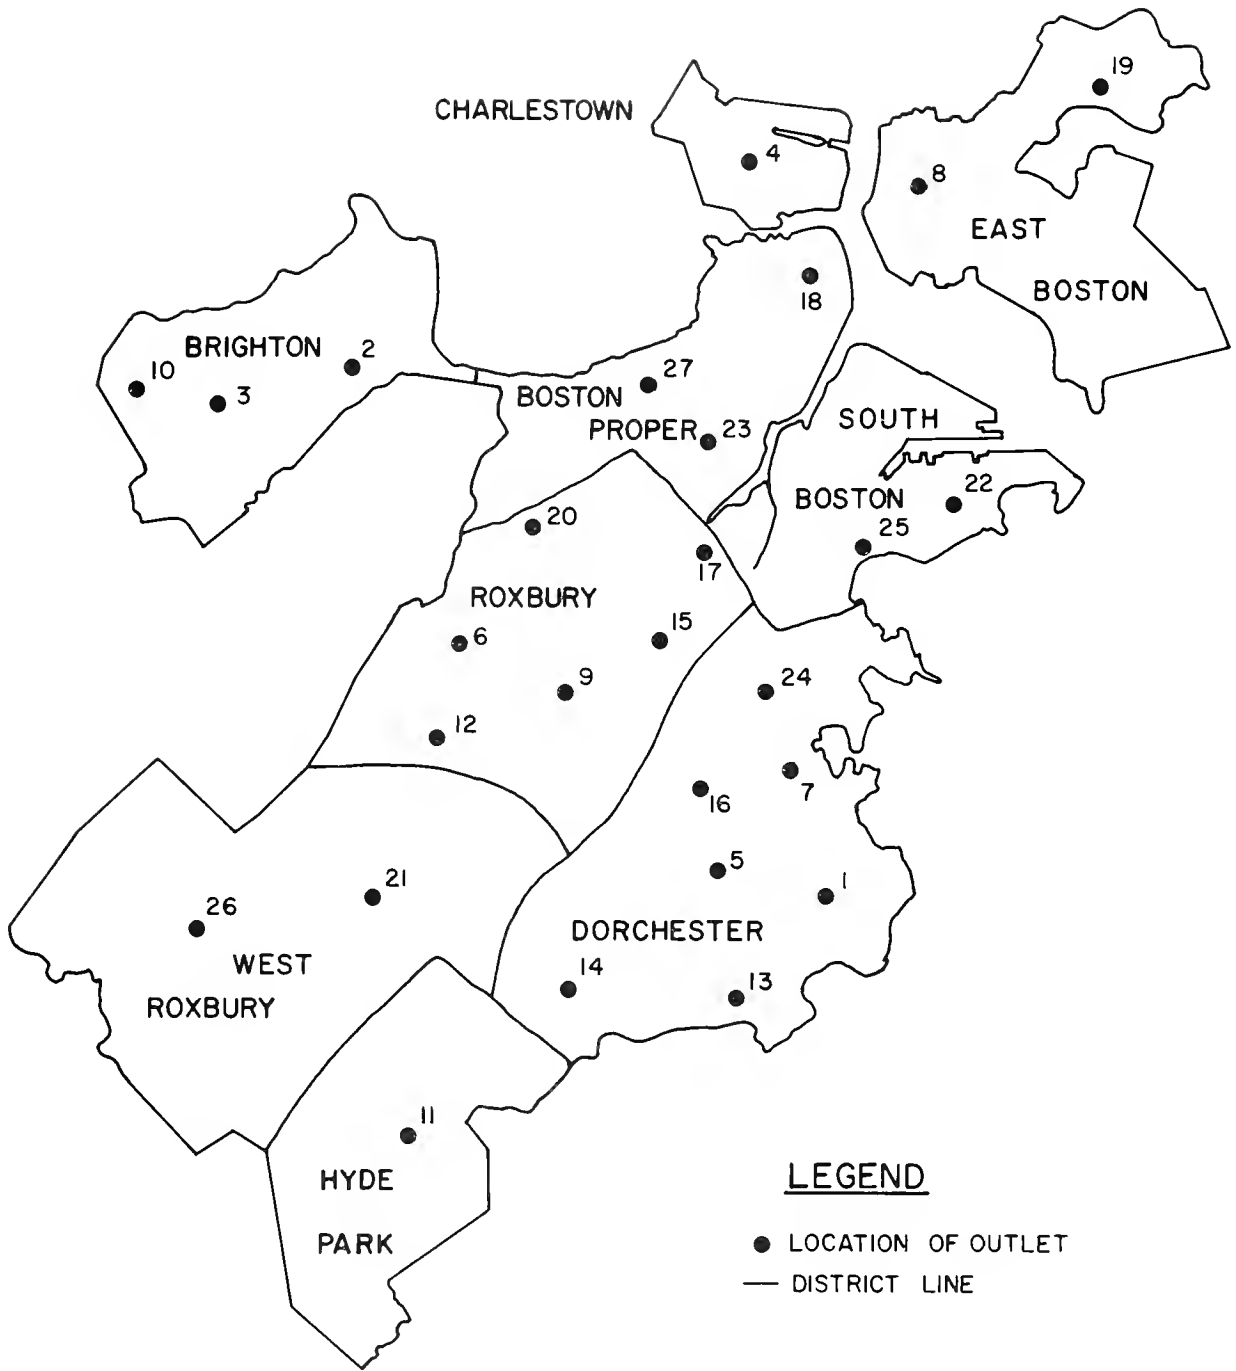

Figure 1: Locations of the Central Library and 26 Branches in Boston in 1963

outlet for each 1.3 square miles; Brighton had roughly one branch for each 1.7 square miles; Charlestown's single branch served a land area of about one square mile; Dorchester had about one branch for each 1.5 square miles; East Boston had roughly one branch for each three square miles; Hyde Park's single branch served a land area of about six square miles; Roxbury had roughly one branch for each 0.8 square miles; South Boston had approximately one branch for each 1.5 square miles; and West Roxbury had one branch for each four square miles. The foregoing figures may be misleading because (1) some branches served more than one district of the city, and (2) the parcels of land devoted to non-residential purposes have been included with the residential areas in the computations.

When circles with radii representing one-half mile distances are drawn around the locations of these library units, as in Fig. 2, it becomes evident that fifteen of the twenty-seven outlets were less than one mile apart. The typical inhabitant of Boston whose home lay between two outlets that were less than one mile apart had to travel no more than one-half mile to reach a public library. Approximately 250,000 residents, or nearly 36 percent of Boston's population, lived more than one-half mile from a public library in 1963.

When circles with radii representing one mile distances are drawn around the locations of existing library units, as in Fig. 3, it becomes evident that all Bostonians needed to travel no more than one mile to reach a stationary library agency, except for those living in some sections of Hyde Park and West Roxbury, Columbia Point (a peninsular section of Dorchester jutting into Dorchester Bay to the south of South Boston), and the Kenmore Square-Boston University area (at the western end of Boston Proper). Other land areas not within the circles are nonresidential. Approximately 23,500 residents, or slightly more than three percent of Boston's population, lived more than one mile from a stationary public library outlet.

As Fig. 4 indicates, all of Columbia Point and the Kenmore Square-Boston University area lay within one and one-half miles of several stationary outlets. Approximately 3,500 persons, or about one-half of one percent of Boston's population, who inhabit parts of the Germantown section of West Roxbury and the Readville section of Hyde Park, were situated more than one and one-half miles from a branch library in 1963.

A stationary public library outlet was found within two miles of every Bostonian's home, as Fig. 5 demonstrates. Only part of Logan International Airport in East Boston and the harbor islands were more than two miles from a branch. Within a two-mile radius of some outlets there were ten other units, while within a two-mile radius of others there was but one. A better distribution of outlets seems desirable in order to give all residents equal access to library service.

In the four independent municipalities selected for comparison, stationary library outlets were distributed as they were in the districts of Boston. Framingham had four units serving an area of 24.1 square miles, or an average of about one outlet for each six square miles; Lexington had two units for its 16.5 square miles, or one for each eight and one-quarter square miles; Malden maintained five units in its 4.8 square miles, or about one unit per square mile; and New Bedford had four outlets for its 19.1 square miles, or one outlet for each 4.75 square miles. In none of these municipalities was a library outlet to be found within one-half mile of every resident's home.

For all urban places in Massachusetts with populations of 20,000 to 100,000 persons in 1960, the median land area was 13.1 square miles, with the range from 1.7 square miles to 46.3 square miles. Since the typical Massachusetts municipality has a compact shape, practically all residents live within two miles of the center, where it is assumed the main library is most often situated. Every normal adult and young adult can therefore easily travel to the main library.

In Boston, the distances from the twenty-six branch libraries in 1963 to the central library at Copley Square varied from seven-tenths of a mile to 6.6 miles. As Table 7 shows, the median distance from a stationary branch to the central library was 3.1 miles, more than the typical adult or young adult can reasonably be expected to travel. By public transportation, the portal-to-portal travel time from branches to the central library ranged from twelve to forty-five minutes, with a median of twenty-six minutes; the figures shown as travel time in Table 7 are based upon a small sample and will vary according to the time of day, weather, and other conditions.

Although three branches were 1.7 miles from the central library, by public transportation it took from twelve to twenty-five minutes to reach the central library from their respective locations. The availability of direct public transit routes made the difference. Even when the travel times were identical, the costs differed because in Boston the subways were more expensive than the buses.

To ascertain travel time for the normal male adult pedestrian, some walking from one branch to another was done by the investigator. Table 8 shows the results of the excursions on foot. Generally speaking, the normal adult male can walk one mile on slightly winding thoroughfares in eighteen minutes.

North End branch	Central library	1.8	32

Travel time between stationary library outlets by private automobile was not measured, but it is known that outside of rush hours when persons are generally traveling to and from work, the use of private automobiles considerably reduces travel time, especially since the major part of the public transportation system in Boston operates on city streets rather than in subways or on elevated tracks. Driving may save travel time, but—with few exceptions—seeking a parking space consumes much of the time saved.

In addition to distance and travel time, hours of service per week must be considered in evaluating accessibility. While the central library in Boston was open seventy-three hours a week during all except the summer months, seventeen branches were open fifty-three hours a week, eight were open forty-seven hours a week, and one was open forty hours a week, as shown in Table 9. The median number of hours of service per week in branch libraries was fifty-three.

Central library		73

In 1961, the main units of the free public libraries in Massachusetts that served between 20,000 and 100,000 persons were open to the public between 37.5 and seventy-three hours per week during most of the year, with a median of 68.5 hours of service per week, as Table 10 indicates. For independent libraries serving between 20,000 and 30,000 persons—the population range served by the middle 50 percent of Boston's branch libraries—the median number of hours was sixty-three with the spread from 37.5 to seventy-two.

The branch libraries in Boston open fifty-three hours per week provided service on four weekday nights, Monday through Thursday, while the branches with forty-seven hours of service were open only on Monday and Thursday evenings; Memorial branch closed at 5:30 p.m. each weekday and was

not open on Saturday mornings, as the other branches were. Libraries which fail to provide much evening service are relatively inaccessible to adults who normally work on weekdays.

\*Data from: Massachusetts. Department of Education. Division of Library Extension. Seventy-third annual report of the Board of Library Commissioners for the year ending June 30, 1962. (Massachusetts Public Document No. 44). [Boston, 1963] pp. 16-21.

\*\*Six municipalities in this population range had more than one independent library and one other town provided no municipal appropriation to the library; these seven were omitted from this table to avoid errors due to inclusion of incomparable data.

In terms of accessibility, adults and young adults living in a typical Massachusetts municipality with between 20,000 and 100,000 inhabitants were better served than the approximately 395,000 inhabitants of Boston aged fourteen and over who resided more than two miles from the central library. The adult and young adult residents of the smaller municipalities could easily travel the distances to the main libraries which were open more than sixty hours a week for their convenience. On the other hand, Bostonians living in many districts with populations comparable in size to those of the smaller municipalities had to travel more than two miles to reach the central library—the only public library outlet open more than sixty hours per week.

For children, neither the Boston Public Library nor any smaller independent public library visited provided a stationary outlet within one-half mile of every resident's home.

## CHAPTER V. SUGGESTED LOCATIONS FOR STATIONARY PUBLIC LIBRARY OUTLETS IN BOSTON

In the selection of desirable locations for stationary public library outlets in the city of Boston, primary consideration was given to travel distances. On the basis of the current state of our knowledge, one-half mile was accepted as the maximum distance that children might reasonably be expected to travel each way going to and from a public library unit, while two miles was accepted as the maximum distance that adults and young adults might reasonably be expected to travel each way for the same purpose. The possibility of using all existing library facilities as part of a proposed system was also considered. In addition, the proximity of main traffic arteries and public transit routes to suggested locations was noted, since adults and young adults could use alternatives to foot travel.

As the result of studying geographic and transportation factors, it was found that a minimum of sixty units would be necessary to provide stationary library outlets within one-half mile of the homes of nearly all residents of Boston. Of the sixty units, six would be situated in Boston Proper, five in Brighton, two in Charlestown, fourteen in Dorchester, four in East Boston, seven in Hyde Park, nine in Roxbury, three in South Boston, and ten in West Roxbury. The sixty locations suggested, which are shown in Fig. 6, are the following:

1. Haymarket Square (Boston Proper)
2. Bennington and Putnam Streets (East Boston)
3. Harvard Avenue and Cambridge Street (Brighton)
4. Jackson Square (Roxbury)
5. Dorchester Avenue and Columbia Road (Dorchester)
6. Washington and Beech Streets (West Roxbury)
7. Harvard Avenue and Winthrop Street (Hyde Park)
8. Codman Square (Dorchester)
9. Monument Square (Charlestown)
10. Copley Square (Boston Proper)
11. Ashley and Blackinton Streets (East Boston)
12. Chestnut Hill Avenue and Chiswick Road (Brighton)
13. Boylston and Jersey Streets (Boston Proper)
14. McBride and Lee Streets (Roxbury)
15. Dudley and Vine Streets (Roxbury)
16. East Broadway and L Streets (South Boston)
17. Corey and Vermont Streets (West Roxbury)
18. Centre and Allandale Streets (West Roxbury)
19. Hyde Park Avenue and Eldridge Road (West Roxbury)
20. Grove Street and Birch Road (West Roxbury)
21. Wolcott Square (Hyde Park)
22. Taunton Avenue and Blake Street (Hyde Park)
23. Washington and Morse Streets (Dorchester)
24. Adams and Arcadia Streets (Dorchester)
25. Blue Hill Avenue and Hazelton Street (Dorchester)
26. Washington and Richmond Streets (Dorchester)
27. Neponset Avenue and Ashmont Street (Dorchester)
28. Charles and Main Streets (Charlestown)
29. Charles and Pinckney Streets (Boston Proper)
30. Kneeland and Tyler Streets (Boston Proper)
31. Blackstone Square (Boston Proper)
32. Frankfort and Maverick Streets (East Boston)
33. Bennington and Byron Streets (East Boston)

34. Oak Square (Brighton)
35. Market and Faneuil Streets (Brighton)
36. Commonwealth Avenue and Washington Street (Brighton)
37. Brigham Circle (Roxbury)
38. Tremont and Ruggles Streets (Roxbury)
39. Centre Street and South Huntington Avenue (Roxbury)
40. Pond and May Streets (Roxbury)
41. Columbus and Walnut Avenues (Roxbury)
42. Warren and Townsend Streets (Roxbury)
43. D and West Third Streets (South Boston)
44. Old Colony Avenue and Vinton Street (South Boston)
45. Columbia Road and Bird Street (Dorchester)
46. Savin Hill Avenue and Tuttle Street (Dorchester)
47. Mount Vernon and Hill Cove Streets (Dorchester)
48. Baker Street and Rumford Road (West Roxbury)
49. Baker Street and Joyce Kilmer Road (West Roxbury)
50. Lagrange and Shaw Streets (West Roxbury)
51. Centre and Ainsworth Streets (West Roxbury)
52. Roslindale Square (West Roxbury)
53. Hyde Park and Ramsdell Avenues (Hyde Park)
54. Beech and Sherrin Streets (Hyde Park)
55. Turtle Pond Parkway and Upton Street (Hyde Park)
56. Summit Street and Williams Avenue (Hyde Park)
57. Blue Hill Avenue and Paxton Street (Dorchester)
58. Selden and Capen Streets (Dorchester)
59. River Street and Gladeside Avenue (Dorchester)
60. Gallivan Boulevard and Frederika Street (Dorchester)

Of the foregoing sixty locations, sixteen (numbers 7, 8, 9, 10, 15, 24, 25, 26, 31, 34, 39, 41, 42, 44, 45, and 52) were occupied by fifteen branches and the central library. The other eleven locations used in 1963 could not be incorporated into this suggested scheme because their inclusion would have required having more than sixty units. With sixty outlets, the Boston Public Library would be able to provide more effective accessibility to library service for all residents than the best independent municipal library in Massachusetts serving 20,000 to 100,000 persons offered in 1963, for Boston would have one outlet for each 0.8 square miles of land area while the best independent city or town visited had one outlet per square mile. There would be no need for bookmobile service because stationary library units would be within reasonable walking distance of nearly all Bostonians.

Since adults and young adults can reasonably be expected to travel a maximum distance of two miles each way going to and from a public library outlet, it was found that a minimum of eight stationary units could provide adults and young adults with effectively equal access to library service. The level of accessibility would be comparable to that offered by main libraries in small independent municipalities.

Public library outlets at locations numbered one through eight in Fig. 6 could serve nearly all adults and young adults in Boston. Copley Square is not one of the sites suggested because (1) all of Charlestown does not lie within a two-mile radius thereof; (2) Haymarket Square is more accessible by public transportation; and (3) the research services provided by the central library at Copley Square can legitimately be segregated from reference and advisory services provided in branches for the general readers and students. By using Haymarket Square as the location of an outlet, the need for North End branch library is eliminated. Location no. 2, Bennington and Putnam Streets is used instead of the present East Boston branch library because (1) part of Orient Heights is more than two miles away from the present unit, and (2) the suggested location is more accessible. In place of Roslindale Square, Washington and Beech Streets is suggested because the former location lies more than two miles from many outlying parts of West Roxbury. The Brighton site is suggested because of its great accessibility. Similarly, Jackson Square in Roxbury is accessible without being too close to other districts. Location no. 5, Dorchester Avenue and Columbia Road, is suggested because of its position between South Boston and Dorchester; it would be able to draw adults and young adults from both districts. The other two suggested sites are presently occupied by the Codman Square and Hyde Park branch libraries.

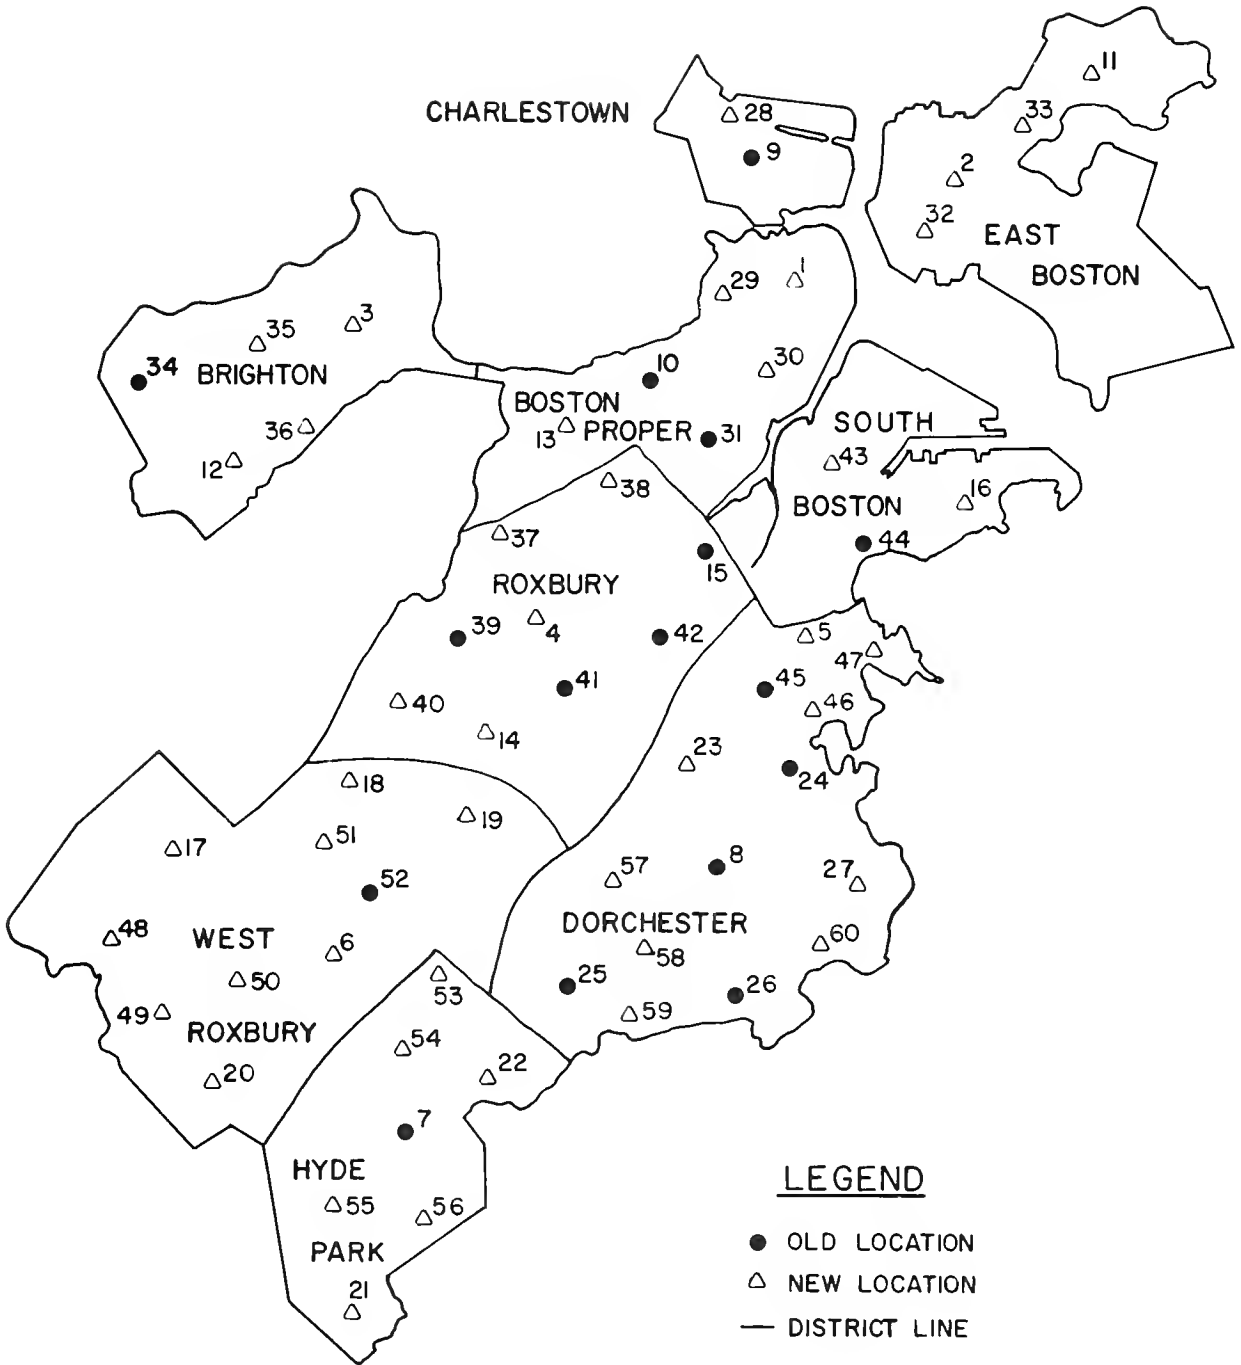

Figure 6: Sixty Suggested Sites for Stationary Public Library Outlets in Boston

To serve children adequately without bookmobile service, fifty-two stationary outlets would be needed in addition to the first eight. With sixty units, no child would have to travel more than one-half mile to reach a public library.

If it is thought that Boston should maintain no more than twenty-seven stationary outlets, locations numbered one through twenty-seven in Fig. 6 should be used in order to provide in a more effective manner equal access to library outlets for all residents. With twenty-seven stationary outlets located approximately one and one-half miles apart, nearly all Bostonians would have to travel no more than three-quarters of a mile to reach a public library. Fig. 7 shows that—as compared with the locations of stationary public library outlets in 1963—the proposed sites are more equitably distributed among the various districts of Boston.

To insure that no child would have to travel more than half a mile to obtain library service, all sixty units would have to be established whether the present branch system is maintained or a regional library system is developed. Under a regional library system, the first eight units would be regional libraries offering the full range of services to all age groups while the other outlets would primarily serve children. On a priority basis, locations numbered 1 through 8 should be used first; locations numbered 9 through 27 should be used next; and finally locations numbered 28 through 60 should be used.

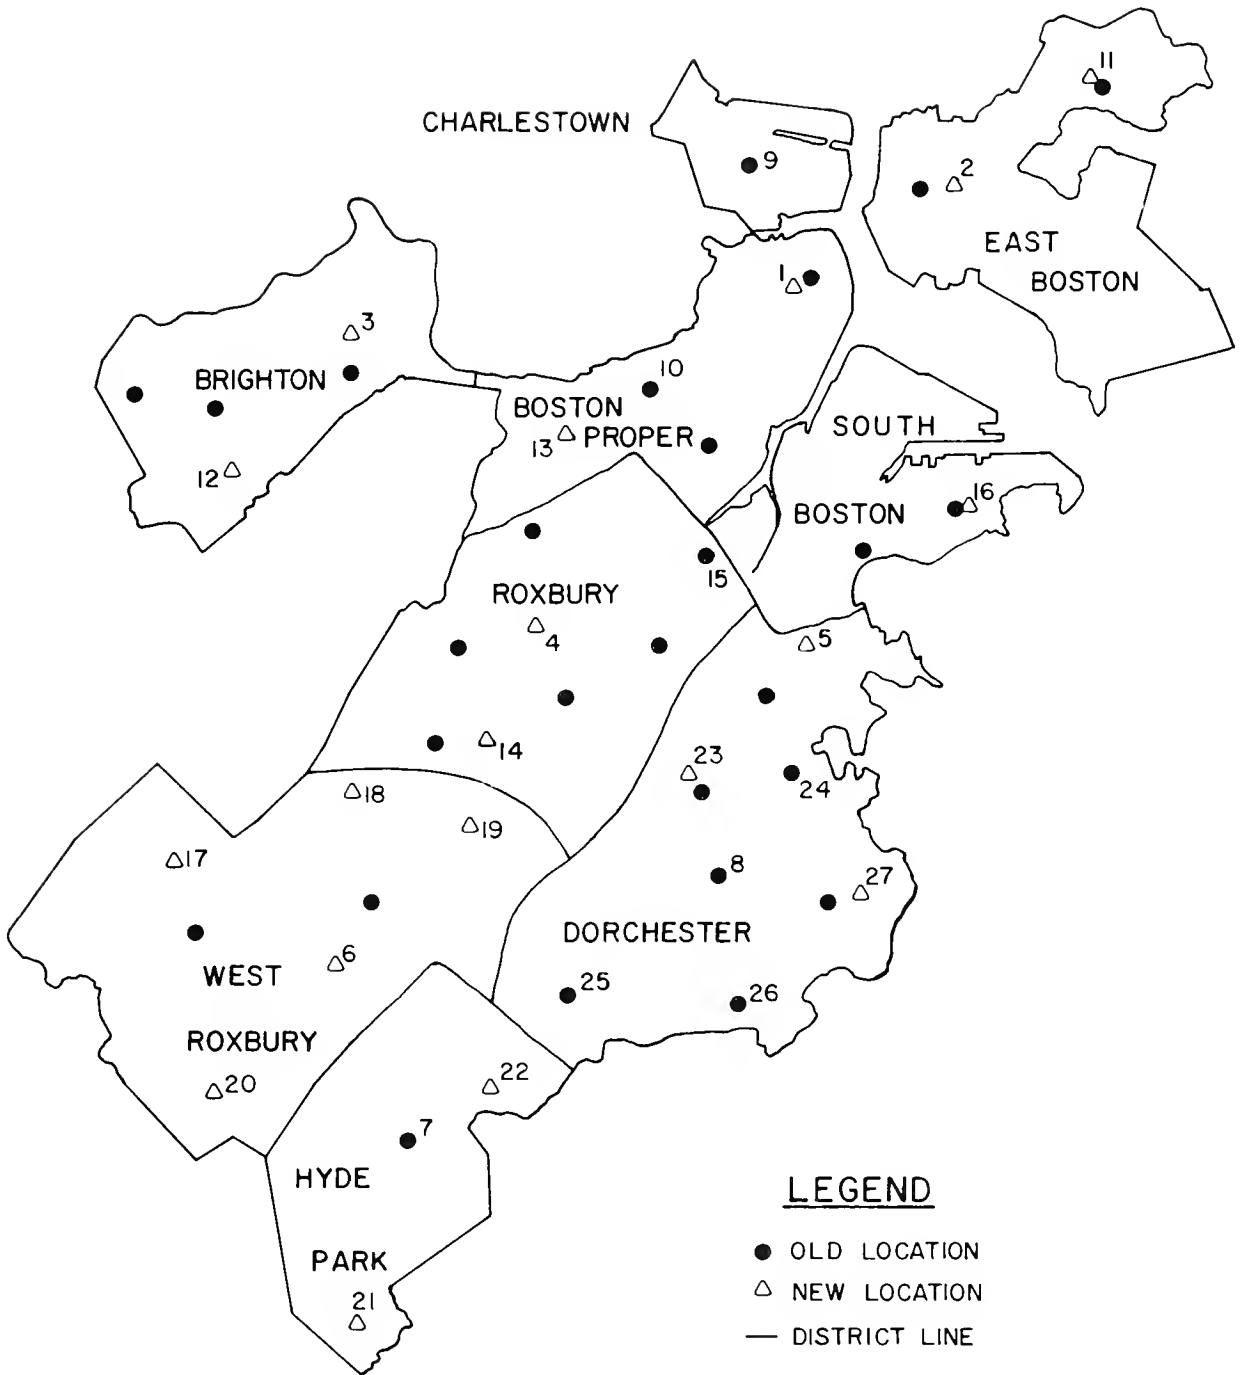

Figure 7: Twenty-seven Suggested Sites for Stationary Public Library Outlets, as Compared with Library Locations in Boston in 1963

CHAPTER VI. A QUANTITATIVE ANALYSIS OF LIBRARY COLLECTIONS AND THE AMOUNTS APPROPRIATED FOR THEIR PURCHASE

The strength of a library's service to the public depends upon the strength of the collections of book and non-book materials which the public can readily use. This chapter will discuss the size of library collections and the book budget.

As of December 31, 1961, the total book stock in the twenty-six stationary branches of the Boston Public Library varied from 11,277 to 31,293 volumes, with the median at 19,754.5 volumes, as Table 11 indicates. Considering the populations served by the various branches, the book stock per capita ranged from 0.5 to 1.6 volumes, with a median of 0.9 volumes per capita.

TABLE 11  
BOOK COLLECTIONS IN STATIONARY BRANCHES OF THE BOSTON PUBLIC LIBRARY,  
AS OF DECEMBER 31, 1961\*

Branch Library	No. of Volumes Held	Estimated Population Served (1960)	Volumes per Capita

West Roxbury	27,367	25,328	1.1
Median	19,754	24,001	0.9

\*Data from Division of Home Reading and Community Service, Boston Public Library.

At the same time, according to data in Table 12, all of the free public libraries in Massachusetts that served between 20,000 and 100,000 persons had collections ranging from 37,624 to 288,484 volumes, with a median collection of 109,507 volumes. For those independent public libraries serving between 20,000 and 30,000 persons, the median collection consisted of 68,607 volumes, or about three and one-half times as many volumes as the typical branch serving the same size of population held; the range extended from 38,053 to 98,000 volumes. On a per capita basis, the independent libraries in the 20,000 to 100,000 population range supplied between 0.9 and 5.3 volumes per capita, with a median of 2.6 volumes per capita. For all of the free public libraries serving between 20,000 and 30,000 persons, the median number of volumes per capita was 2.8 and the range was from 1.8 to 3.6. Residents of small independent towns had available to them three times as many books per capita as residents of branch service areas in Boston, unless these Bostonians used the resources of the central library.

In the Boston Public Library as a whole, there were 2,182,355 volumes at the end of 1961, or 3.1 volumes for each Bostonian. Of the total book stock, 1,434,577 volumes (65.7 percent) were in the Division of Reference and Research Services and another 128,035 books were housed in units of the Division of Home Reading and Community Services located in the central library.

In the four independent public libraries selected for comparison with Boston's branches, the total book collections ranged from 98,000 volumes to 316,920 volumes, with a median of 134,991.5 volumes, as Table 13 indicates; the number of volumes per capita varied from 2.5 to 3.5 with a median of 3.0. In the two high school libraries selected for comparison, the collections consisted of 7,000 volumes and 11,300 volumes each, with a median of 9,150 volumes; one school library supplied 4.7 volumes per student while the other supplied 7.1 volumes per student, the median being 5.9. The new standards for school libraries call for ten volumes per pupil.<sup>1</sup> Neither of the two high school libraries visited held book stocks that met established standards.

The 533,101 books in the twenty-six stationary branches of the Boston Public Library at the end of 1961 were divided according to age groups—those for adults, young adults, and children. As Table 14 shows, adult and young adult collections constituted nearly three-fifths of the typical branch's book stock. The adult and young adult collections varied from 5,979 to 16,360 volumes, with a median of 12,013.5 volumes.

Data for the year ending December 31, 1961, did not include a breakdown of adult and young adult collections into fiction and non-fiction books; such information was only available for stationary branch collections as of February 1, 1963.<sup>2</sup> With all branches except one reporting, the adult and young adult collections still constituted 59 percent of the typical branch's book stock, as shown in Table 15. Fiction accounted for 36 percent of the total adult and young adult collections while non-fiction accounted for 64 percent. For the twenty-five stationary branches which furnished data, the range in the number of volumes of adult and young adult fiction was from 2,371 to 8,456, with a median of 4,234; from 3,609 to 11,809 volumes of adult and young adult nonfiction were held in the branches, with a median of 7,370 volumes.

As Table 14 indicates, 41 percent of the typical stationary branch's collections was composed of books for children. The number of children's books at the end of 1961 ranged from 5,298 to 14,933, with a median of 8,201.

The holdings of children's volumes as of February 1, 1963, are shown in Table 15. A comparison of the columns for adult and young adult nonfiction and for children's books indicates that the typical stationary branch held larger collections of juvenile books than of adult and young adult nonfiction. The median number of children's volumes held near the beginning of 1963 was 8,354, as compared with 7,370 for adult and young adult nonfiction.

Nineteen of the Boston branches had some recordings as part of their collections at the end of 1961, as Table 16 indicates. Branch holdings ranged from 5 to 544 records. At the central library, a collection of 6,004 recordings was available for circulation while 4,982 more records were reference items. Three of the four independent public libraries visited—those at Framingham, Lexington, and Malden—had collections of recordings. Statistics were not obtained at Lexington, but at Framingham there were 2,536 records and at Malden there were 3,984 records as of December 31, 1962.

Films were available to the branches in Boston through the Audio-Visual Department at the central library. The collection consisted of 1,277 films at the end of 1961. At the end of 1962, the Framingham and Malden libraries had 145 and 9 films, respectively.

As Table 17 reveals, the number of periodicals received by stationary branches in Boston during 1961 varied from twenty-eight to sixty-six, with a median of 46.8. During 1963, as shown in Table 18, the four independent public libraries selected for comparison received between 79 and 355 periodical

titles, the median number of titles being 240, while the two high school libraries selected for comparison received a median of fifty-three titles, fifteen periodicals being received by one library and ninety-one by the other. The medians for both the independent public libraries and the high school libraries were higher than that for stationary branch libraries. However, the new school library standards recommend that senior high schools receive at least 120 periodical titles in their libraries.<sup>1</sup> If the school libraries visited had met the national standards, they would have had almost three times as many titles as the typical stationary branch in Boston.

None of the stationary branch libraries in Boston retained back copies of periodicals for more than two years, but the central library bound virtually all issues received. While the two high school libraries visited did not maintain back files of periodicals for longer periods than the branches in Boston, except for one which had a few items on microfilm, the four independent libraries held long sets of periodical titles, but no statistics were gathered on the time-spans involved.

In a public library, a static collection of books soon becomes outdated and loses its usefulness. New books must constantly be added to a collection so that it will remain valuable to users of the library. The extent to which stationary branches in Boston acquired books during 1961 is depicted in Table 19. Data on the number of titles accessioned were not available. The median number of volumes added by branches was 2,227.5, with the range from 1,406 to 14,059. While the median number of adult and young adult books added was 1,176, with the range from 706 to 4,515, the median number of

\*Data from Division of Home Reading and Community Services, Boston Public Library.

children's books added was 1,069, with the range from 700 to 9,544. Of the 71,943 volumes added to the collections in stationary branch libraries in Boston in 1961, 35,361, or about 49 percent, were adult and young adult books and 36,582, or about 51 percent, were juvenile books.

Comparable statistics on accessions in independent libraries in Massachusetts were not available. However, some data on acquisitions for the year ending December 31, 1962, were obtained at the Framingham and Malden libraries. The Framingham Town Library added 9,915 volumes, of which 5,419 (55 percent), were adult books and the rest juvenile; and the Malden Public Library accessioned 8,300 books.

During 1961, the Boston Public Library spent a total of \$338,407 for the purchase of books and periodicals, or forty-eight cents for every Bostonian. For books, \$270,337 was expended—\$95,155, including \$58,395 of trust funds, by the Division of Reference and Research Services and \$175,183, including \$1,772 of trust funds, by the Division of Home Reading and Community Services; the twenty-six stationary branch libraries are part of the latter division. The distribution among the branches of funds for books and periodicals that came from city appropriations for 1961 is shown in Table 20; trust funds amounted to a small fraction of total branch funds for the purchase of books and periodicals, and are not shown.

City appropriations to stationary branches for books and periodicals varied from \$3,034 to \$9,324 in 1961, with a median of \$4,751. On a per capita basis, the range was from ten cents to thirty-six cents, with a median of twenty-two cents per capita, or less than half of the system-wide per capita expenditure for books and periodicals of forty-eight cents, which included trust funds. The appropriations for periodicals amounted to about 4 percent of the total funds shown in Table 20.

TABLE 20

Median	4,751	24,001	.22

\*Data from Division of Business Operations, Boston Public Library.

Table 21 depicts the total appropriations for books and periodicals in all of the independent public libraries in Massachusetts serving between 20,000 and 100,000 persons. In 1961, these libraries received between \$5,108 and \$62,097 in funds for the purchase of books and periodicals; the median amount was \$17,107. On a per capita basis, the range was from sixteen cents to \$1.15, with a median of forty cents. For all of the independent libraries in the 20,000 to 30,000 population range, the median appropriation was \$12,890, with the spread from \$5,309 to \$29,698; the typical small library was spending more than two and one-half times as much money on books and periodicals as the typical stationary branch library in Boston which was serving a comparable population. On a per capita basis, too, the small independent library was spending two and one-half times as much for basic library materials as the typical Boston branch, for the median per capita appropriation for books and periodicals in the municipal library serving 20,000 to 30,000 residents was fifty-three cents as compared to twenty-two cents in the median branch; the range for the small independent libraries extended from twenty-six cents to \$1.07 per capita.

In independent public libraries in Massachusetts serving between 20,000 and 100,000 persons, the library collections and the annual appropriations for the purchase of books and periodicals are larger than in stationary branch libraries in Boston.

\*Data from: Massachusetts. Department of Education. Division of Library Extension. Seventy-third annual report of the Board of Library Commissioners for the year ending June 30, 1962. (Massachusetts Public Document No. 44) [Boston, 1963] pp. 16-21.

\*\*Six municipalities in this population range had more than one independent library and one other town provided no municipal appropriation to the library; these seven were omitted from this table to avoid errors due to inclusion of incomparable data.

CHAPTER VII. A QUALITATIVE ANALYSIS OF LIBRARY COLLECTIONS

In this study, the instruments used for evaluating the quality of collections in the stationary branch libraries and central library of Boston, the central libraries of four smaller municipalities in Massachusetts, and two high school libraries were checklists of books and periodicals developed from nationally known standard lists. While it would be very difficult to get complete agreement on any list of items for checking the quality of holdings, the same checklists were used in analyzing the holdings of all libraries, so the results obtained in all libraries are comparable. On all lists, the central library in Boston had more than 90 percent of the items, showing the validity of the lists for the Boston Public Library.

With respect to the checklist of children's titles, while the central library in Boston held 483, or 96.6 percent, of the 500 items on the list, the median number of titles held by the 26 stationary branches was 392, or 78.4 percent, with the range from 320 (64 percent) to 463 (92.6 percent) as Table 22 reveals. For the four independent public libraries that were visited, the median was 430

TABLE 22  
HOLDINGS OF ITEMS ON CHECKLIST OF CHILDREN'S TITLES IN STATIONARY BRANCHES  
OF THE BOSTON PUBLIC LIBRARY, 1963

Branch Library	No. of Items Held	As Percent of List (N = 500)
Adams Street	378	75.6
Allston	410	82.0
Brighton	396	79.2
Charlestown	414	82.8
Codman Square	416	83.2
Connolly	399	79.8
Dorchester	405	81.0
East Boston	372	74.4
Egleston Square	463	92.6
Faneuil	359	71.8

Washington Village	347	69.4
West Roxbury	438	87.6
Median	392	78.4

(86 percent) with the range from 379 (75.8 percent) to 476 (95.2 percent) as shown in Table 23. Table 23 also indicates that both high school libraries studied held fewer than 10 percent of the titles on the checklist of children's books, as one might have expected. In terms of quality, the typical children's collection in an independent public library in Massachusetts serving between about 20,000 and 100,000 persons was only slightly superior to the typical children's collections in a stationary branch library in Boston in 1963, the median independent public library having scored 7.6 percent higher than the median branch on the checklist used for evaluation.

TABLE 23

HOLDINGS OF ITEMS ON CHECKLIST OF CHILDREN'S TITLES IN SELECTED PUBLIC AND HIGH SCHOOL LIBRARIES IN MASSACHUSETTS, 1963

Library	No. of Items Held	As Percent of List (N = 500)
Cary Memorial Library of Lexington	476	95.2
Framingham Town Library	427	85.4
Malden Public Library	379	75.8
New Bedford Free Public Library	433	86.6
Median	430	86.0
Boston Girls Latin School Library	31	6.2
Newton South High School Library	49	9.8
Median	40	8.0

As for the checklist of adult and young adult fiction titles, while the central library in Boston held all 257 items on the list, the median number of titles held by the stationary branches was 171.5 (66.7 percent), with the range from 118 (45.9 percent) to 225 (87.5 percent) as Table 24 indicates. For the four independent public libraries that were visited, the median was 250.5, or 97.5 percent, with the range from 243 (94.6 percent) to 252 (98.1 percent) as depicted in Table 25. Of the two high school libraries, as Table 25 shows, one held 108 (42 percent) of the 257 checklist items while the other held 190 (73.9 percent) with the median being 149, or 58 percent. In terms of quality, the typical fiction collections for adults and young adults in an independent public library in Massachusetts serving between about 20,000 and 100,000 persons were far superior to the typical fiction collections for adults and young adults in a stationary branch library in Boston in 1963, the median independent public library having scored 30.8 percent higher than the median branch on the checklist used as a measuring instrument. The lowest-scoring independent library had fiction collections that were better in quality than those found in any public library outlet in Boston except the central library, as shown by the fact that the lowest independent library score surpassed the highest branch library score by 7.1 percent. One of the two high school libraries visited had a fiction collection superior in quality to the collections at more than half of the stationary branches in Boston since the score made by the school library was higher than the median branch score by 7.2 percent.

On the checklist of adult and young adult nonfiction titles, while the central library in Boston held 702 (93.5 percent) of the 751 items, the median number of titles held by the twenty-six stationary branches was 305.5 (40.7 percent) with the range from 201 (26.8 percent) to 414 (55.1 percent) as Table 26 reveals. The four independent public libraries held from 524 items, or 69.8 percent to 585 items, or 77.9 percent, the median being 559, or 74.4 percent, as depicted in Table 27. Table 27 also shows that the median number of items held by the two high school libraries was 374.5, or almost half of the 751 entries on the list; one library held 264, or 35.2 percent, while the other held 485, or 64.6 percent. The typical independent public library in Massachusetts furnished its users with collections of nonfiction that were overwhelmingly superior in quality to the nonfiction collections provided for adults and young adults by the typical stationary branch in Boston in 1963, the median independent public library having scored 33.7 percent higher than the median branch on the checklist. The median for the two high school libraries was 9.2 percent higher than the median for the branches. The nonfiction collections at the lowest-scoring independent library were better than those found at all public library outlets in Boston aside from the central library, for the lowest independent library score surpassed the highest branch library score by 14.7 percent. One of the two high school libraries visited also had a nonfiction collection superior in quality to those at all Boston public libraries except for

the main library. This high school library held 64.6 percent of the checklist items as compared with 55.1 percent at the highest ranking branch.

When the holdings of the 751 items on the checklist of adult and young adult nonfiction are arranged in large subject groupings according to the Dewey decimal classification, the specific weaknesses of the nonfiction collections in stationary branches in Boston becomes apparent. As shown in Tables 28 and 29, the median branch held fewer titles on the selected list than did the median of the four independent libraries. In only two subject areas out of eleven (the 100's and the 600's) did the median branch exceed the median average holding of the two high school libraries.

The extent to which the stationary branch libraries in Boston received periodicals of recognized quality during 1963 is shown by Table 30. While the central library in the city received all of the 128 checklist items, the median branch library received only thirty-two items, or one-quarter of the total, with the range from twenty (15.6 percent) to forty-seven (36.7 percent). For the four independent public

TABLE 30

NUMBER OF ITEMS ON CHECKLIST OF PERIODICAL TITLES RECEIVED BY STATIONARY  
BRANCHES OF THE BOSTON PUBLIC LIBRARY, AS OF JULY, 1963

Branch Library	No. of Items Received	As Percent of List (N = 128)
Adams Street	39	30.5
Allston	21	16.4
Brighton	26	20.3
Charlestown	36	28.1
Codman Square	45	35.2
Connolly	35	27.3
Dorchester	31	24.2
East Boston	29	22.7
Egleston Square	36	28.1

Washington Village	33	25.8
West Roxbury	38	29.7
Median	32	25.0

libraries, the median number of periodical checklist items received in 1963 was 107 (83.6 percent) with the range from 76 (59.4 percent) to 114 (89.1 percent) as Table 31 indicates. Of the two high school libraries, as also shown in Table 31, one received thirteen checklist items (10.2 percent) while the other received fifty-one titles (39.8 percent) with the result that the median was the same as that for the typical branch, thirty-two items or 25 percent of the total. In terms of quality, the periodicals collection in the typical independent public library in Massachusetts serving a population between 20,000 and 100,000 persons was far superior to that found in the typical stationary branch library in Boston in 1963, since the median number of checklist items received by the former library exceeded the median number of titles received by the latter by 58.6 percent. The periodicals collection at the lowest scoring independent library was better than that found at any public library outlet in Boston with the exception of the central library, for the lowest independent library score surpassed the highest branch library score by 22.7 percent.

Since one aspect of the quality of a periodicals collection is the extent of back files, it should be noted that none of the stationary branch libraries in Boston retained back copies for more than two years, so that their periodicals collections were inadequate for most reference work. The two high school libraries visited also did not maintain extensive back files, although one had a few items available on microfilm. The central library in Boston and the four independent public libraries, however, held long—and sometimes complete—sets of periodicals for reference use; no statistics were gathered on the length of back files.

The user of the typical free public library in Massachusetts in the 20,000 to 100,000 population range had readily available to him better collections of children's books, adult and young adult fiction and nonfiction, and periodicals than he could obtain by visiting the typical stationary branch library in Boston in 1963. The better high school library, too, had collections of adult and young adult fiction and nonfiction, and periodicals that were superior in quality to what was available at the typical Boston branch. To obtain a supply of high quality materials comparable to what he would have had available if he lived in a municipality of 20,000 to 100,000 inhabitants, a resident of Boston had to travel to the central library or request that items be sent to his neighborhood branch through interdepartmental loan service. Reference items and periodicals, however, would not be sent to branches through interdepartmental loan service.

TABLE 31

NUMBER OF ITEMS ON CHECKLIST OF PERIODICAL TITLES RECEIVED BY SELECTED PUBLIC AND HIGH SCHOOL LIBRARIES IN MASSACHUSETTS, AS OF JULY, 1963

Median	32	25.0

## CHAPTER VIII. READER SERVICES PROVIDED BY PUBLIC LIBRARIES

The services provided for adults, young adults, and children from July 1, 1962, through June 30, 1963, by the stationary outlets of the Boston Public Library and the main libraries in four Massachusetts municipalities with about 20,000 to 100,000 inhabitants were compared. Data were obtained through interviews with librarians conducted in the spring and summer of 1963, during which copies of the checklist of reader services (shown as Appendix I) were filled out.

Services for children were offered by all of the public libraries visited, but the definition of children varied. In Boston, Framingham, Malden, and New Bedford, children's areas in public libraries were reserved for youngsters through thirteen years of age, or the eighth grade in school, while in Lexington, youngsters above the sixth grade were no longer restricted to the children's room of the library.

Elementary school libraries had been established in Lexington, but not in Boston or the other three independent municipalities. Therefore, the public libraries supplied the only library service available to children in Boston, Framingham, Malden, and New Bedford. During the 1962-63 school year, deposit collections were officially supplied to elementary school classrooms in Framingham, Malden, and New Bedford by the respective public libraries. Small children in Boston, however, had to travel to the nearest stationary neighborhood outlet for their library books, unless bookmobiles stopped at their schools weekly. Since the Boston Public Library suspended operation of its classroom deposit service in 1960, a few branch librarians reported furnishing some book collections unofficially to a small number of teachers.

All public libraries visited provided children with materials for home use, reference service, and reading guidance. Because the quality of these services is dependent upon the quality of the collections—and the collections were shown to be slightly superior in small independent libraries—it is assumed that the libraries in the small municipalities were able to provide these services slightly better than the branches in Boston. No comparable statistics on the amount of reference service and reading guidance given to individuals were gathered. Most Boston outlets and the four independent libraries offered to reserve items for children when these materials were temporarily unavailable.

Although reader interest files and reading records were not maintained, all children's librarians reported conferring with some parents about the reading of their children; reliable statistics on this matter could not be obtained. The absence of adequate communication between teachers and librarians with regard to class assignments and the reading of individual students was mentioned by children's librarians. None of the public libraries studied distributed forms to teachers upon which the teachers could note future assignments so that the librarians might be able to plan ahead. The development of planned reading programs for individual youngsters was not reported by any of the children's librarians. More teacher-librarian cooperation would probably improve library service to children in all libraries.

Half of Boston's twenty-six stationary branches prepared booklists for children during the year ended June 30, 1963, as shown in Table 32: the statistics presented were not truly comparable because of variations in the content of the bibliographies. At the central library in Boston, about fifty booklists were prepared by the reader's adviser for children; in most cases, these bibliographies were mass-produced and distributed to all outlets in the system. Only one of the four independent libraries, as Table 33 indicates, issued booklists for children. With regard to this service, Boston's branch libraries seem to have done a better job than the independent libraries; only half of the branches, however, provided booklists for youngsters.

Each of the outlets in the Boston Public Library sponsored summer reading clubs for children during 1962; the number of active participants in each is shown in Table 32. One branch library also sponsored a reading club throughout the year. As Table 33 illustrates, only one independent library maintained a summer reading club while the other three did not; none of the four independent libraries ran a year-round reading club.

<sup>a</sup>Excludes story hours presented as part of class visits.

<sup>b</sup> These are mutually exclusive categories.

<sup>c</sup>Excludes story hour groups and summer reading clubs, but includes year-round reading, puppetry group, and drama club.

Both preschool story hours and regular story hours for older youngsters were presented by the public libraries studied, as shown in Tables 32 and 33. Sixteen of Boston's twenty-six branches provided children with preschool story hours—five branches offering them every two weeks, ten branches offering them once a week, and one branch offering them twice a week. One independent library presented preschool story hours weekly, another offered a total of twelve during the summer, and the

other two provided none. The central library in Boston provided no programs for preschool youngsters, but did present two regular story hours a month. With regard to regular story hours, nineteen branches scheduled them—five provided them twice a month, one offered them three times a month, and thirteen ran weekly programs. Of the four independent libraries, one presented one regular story hour a year while the others presented none. In terms of story hours, the branch libraries in Boston were providing service superior to that available at independent public libraries in Massachusetts serving approximately 20,000 to 100,000 persons.

Orientation and instruction in the use of libraries and library materials are important aspects of the work of children's librarians. Although some of this is accomplished on an individual basis, the bulk of the orientation and instruction is carried out through visits by classes of students to the libraries and through visits by librarians to classes of students in schools. As Table 32 indicates, twenty-two of Boston's twenty-six branches were visited by some classes during the 1962-63 school year, but it was more common for children's librarians to visit classes in schools; in some cases, groups of children other than school classes visited libraries or were visited by librarians. Although data were not supplied, children's librarians reported that, on the average, those classes in Boston which met with librarians, either in schools or libraries, received orientation and/or instruction

twice a year. Story-telling or a book talk was part of every orientation meeting. Group instruction was given less frequently, as Table 32 shows, but when it was given, the two were often combined. There were fewer group visits at the central library in Boston than at several branches.

Of the four independent libraries, all but one furnished figures on group orientation and instruction, as depicted in Table 33. In Framingham, all school classes visited the library about fifteen times per school year, making a total of 270 visits, so that visits to classes by the children's librarians were unnecessary. The other two independent libraries reporting data indicated that there were few group visits, as shown in Table 33; one of these libraries was in Lexington, where school library service had been established on all levels. Although the evidence is inconclusive, the typical stationary branch outlet in Boston appears to have been doing more than the typical main library in independent municipalities with about 20,000 to 100,000 inhabitants, with regard to group orientation and instruction.

Other group services made available to children by these public libraries included film showings, lectures, both live and recorded musical programs, programs of recorded stories and poetry, puppet shows, library-sponsored groups, and space for group meetings and art exhibits, as shown in Tables 32 and 33. While sixteen of the twenty-six branch libraries in Boston presented from one to four film showings a month for youngsters, only one independent library presented film showings for children—and this one on a monthly basis. Although singing and the playing of records were often part of pre-school story hours, seven branches presented programs of recorded music for children, one had a live folksinger as a guest, and four provided programs of recorded stories and poetry for youngsters, while none of the independent libraries provided these special group services. One independent library, however, provided a service for children that none of the other libraries, in Boston or elsewhere, presented—a lecture by an author of children's books.

Two branch libraries in Boston and two independent libraries offered puppet shows. While none of the independent libraries have sponsored groups of children interested in book-related pursuits, two branches have; one organized a puppetry group, and the other a drama club. During the year which ended June 30, 1963, organized groups of children, such as Boy Scouts and Campfire Girls, met at seven branch libraries in Boston for purposes not specifically related to the library; none of the independent libraries served as meeting places for groups of children. Finally, all of Boston's libraries provided space for exhibitions of children's art while only one independent library did likewise.

Because of the slightly lower quality of children's book collections in Boston's branch libraries, it is assumed that the quality of their lending service, reference service, and advisory service was slightly lower than that at independent public libraries; in terms of group services, however, the branches were better than the independent libraries, for they provided a larger number of activities.

Special services for young adults—persons between the ages of fourteen and eighteen—were supplied to a limited degree by all of the libraries visited. In all stationary outlets of the Boston Public Library, as well as in the independent libraries, special areas were set aside for young adult materials. Little distinction was made between services for young adults and services for adults, so that these two groups may be thought of as a unit.

The adults and young adults using one of the branch libraries in Boston were able to obtain many of the books that were not available in the local outlet from the large collections of the central library or from one of the other branches through interdepartmental loan service, which was offered to borrowers without charge. Similarly, users of the main library in any independent municipality in Massachusetts were able to secure many items that were not in the library they visited, through interlibrary loan service made possible by the Division of Library Extension of the Massachusetts Department of Education and by other cooperative libraries; shipping charges were often paid by the individual borrowers.

Table 34 shows that the twenty-six stationary branches in Boston requested from the Branch Issue Department in the central library between 1,400 and 7,560 items during the year which ended June 30, 1963. Three independent public librarians who were interviewed estimated that they made from five to 2,500 annual requests for interlibrary loans, as Table 35 indicates. Based upon the limited data available, it seems that the individual branch libraries made many more requests for loans from other libraries than the independent public libraries did. The heavier use of this service by patrons in branches could be attributed primarily to the demonstrated relative inferiority of branch collections for adults and young adults; as a result of their deficiencies, branch libraries may have required larger supplements from other libraries than independent libraries did. Another reason for the greater use of interdepartmental loan service was that loans within the Boston Public Library system were usually faster and less costly to arrange than interlibrary loans between independent libraries. An interdepartmental delivery service operated daily in Boston.

<sup>a</sup>Computed by multiplying the estimated daily averages by 280, the approximate number of days per year the branch libraries were open.

<sup>b</sup>Excludes booktalks given as part of group visits.

<sup>c</sup>These are mutually exclusive categories.

Interdepartmental loan service was far from perfect, however, for less than half of the approximately 95,000 items requested during 1962 from the Branch Issue Department were sent to the branches seeking them.<sup>1</sup> Some of this failure to fill requests was due to the fact that such materials as periodicals and reference books were not lent from one department to another. Since branches could not borrow all that they wished from other libraries, they needed to maintain collections adequate to provide high quality library service to users.

All public libraries visited provided adults and young adults with lending and reserve book service. There were no formal reading records for guidance purposes and no reader interest files linked to the reserve book service in any of the outlets studied. As Tables 34 and 35 indicate, there was little development of planned reading programs for individuals at any of the libraries, with the exception of the central library in Boston, to which Bostonians were often referred by the branches; during the year which ended June 30, 1963, it was estimated that the reader's adviser for adults prepared reading programs for fifty individuals while the reader's adviser for young adults developed reading lists for thirty-five teenagers, the combined figure being shown in Table 34.

Reference service was offered to adults and young adults at all libraries visited. No comparable statistics were available for the outlets in Boston and elsewhere. Since the quality of reference service depends upon the quality of nonfiction collections for adults and young adults, it is assumed that the service provided in stationary branches of the Boston Public Library was of a lower quality than that available at the central library in Boston and at the central libraries in the four Massachusetts municipalities whose populations ranged from 20,000 to 100,000 persons, in view of the relative inferiority of branch collections of adult and young adult nonfiction. Photocopying service was not offered at any Boston branch or at Framingham Town Library; it was offered at the central library in Boston and at the other three independent libraries.

Reading guidance was provided to adults and young adults at all the libraries visited. Comparable statistics were not available on the amount of service given in every library outlet studied. Although lists of new accessions were compiled by nearly all libraries, few booklists for groups of adults and young adults were prepared at any of the libraries, except for the central library in Boston, as shown in Tables 34 and 35; the reader's adviser for adults and young adults developed a total of 125 lists, seventy-five for adults and fifty for young adults. The largest number of lists produced at a branch was thirty and the largest number produced at an independent library was seven.

All library agencies visited reported some participation in community activities, ranging from attendance at meetings of community groups to contributing articles to local newspapers. Lists of community organizations and agencies, materials dealing with local historical events, information on local educational, cultural, and vocational opportunities, civil service announcements, and program planning advisory service for leaders of community groups were available at all public libraries studied, both in Boston and elsewhere.

Further involvement of libraries in community life was shown by the fact that twelve of the twenty-six branch libraries in Boston and all of the independent libraries provided free meeting space for adult and young adult groups in the communities they served, as indicated by Tables 34 and 35. Similarly, all of the branches and three of the four independent public libraries exhibited the work of local artists.

Group services provided for adults and young adults included library-sponsored groups, such as Friends of the Library, mothers' clubs, groups for senior citizens, Great Books discussion groups, young adult councils, and an art society; book talks; lectures, usually by subject specialists from outside the library; panel discussions; musical programs, either live or recorded; and film showings, as listed in Tables 34 and 35. Half of the branches in Boston sponsored groups at the same time that half of the independent libraries did; the variety of library-sponsored groups was greater in Boston because each outlet had different groups. Seventeen branches presented book talks for adults and young adults, as compared with two of the four independent libraries; the largest number of book talks given during the year ended June 30, 1963, in any library visited was less than fifteen, as shown in the tables.

With regard to lectures, half of the branches scheduled them while three of the four independent libraries did, the highest frequency for branch libraries being twenty-three per year and the highest frequency for independent libraries being nine per year. Four branches reported holding no more than two panel discussions each during the year, but none of the independent libraries held any. While only one independent library scheduled concerts, five branches sponsored musical programs, both live and recorded. At none of the four independent libraries were film showings presented for adults and young adults, although films were incorporated into the lecture series at one of the independent libraries; during the year ended June 30, 1963, eleven of the branches in Boston scheduled from one to twenty

TABLE 35

<sup>b</sup>These are mutually exclusive categories.

film programs for these age groups while the central library had four shows a day, one day a week, eight months a year, for a total of 144 showings a year.

Group orientation and instruction in the use of the library and of library materials played a smaller role in the workload of staffs serving adults and young adults than in the workload of children's librarians, because high school and college students often receive orientation and instruction from high school and college librarians rather than from public librarians. In the case of adults not attending schools, only those belonging to community groups had the opportunity to obtain group orientation and instruction—and these groups often lacked the time or the inclination.

As Table 34 shows, twenty of the twenty-six branches in Boston supplied some orientation to adult and young adult groups, with eight of the branches providing some instruction sessions, too; the central library arranged orientation tours and some visits by staff to community groups, but no instruction in the use of the library and library materials was given. Of the four independent libraries, as depicted in Table 35, one furnished no orientation or instruction to groups of adults and young adults, two provided only orientation, and one supplied both orientation and instruction. When instruction was given, high school classes were the only groups involved. On the basis of the limited data gathered, the typical branch library appeared to be providing more group orientation and instruction than the typical independent library.

In addition to these services, eight branches and the central library in Boston, as well as three of the four independent libraries, reported that they deposited collections of books at nursing homes, settlement houses, and homes for the aged. Estimates of the number of volumes supplied to groups as deposits in the course of a year are shown in Tables 34 and 35.

The reader services provided for adults, young adults, and children by the branch libraries in Boston and the main libraries in the four Massachusetts municipalities with about 20,000 to 100,000 inhabitants, differ in terms of the range of services and the quality of services. When the services are dichotomized into those that depend heavily upon the book collections (circulation, reference, reading guidance, etc.) and those that may be provided without extensive book stocks (story hours, audio-visual programs, orientation, etc.) the differences between the branches and the independent libraries become apparent. Branch libraries supplied a wider range of services not specifically dependent upon the book collections than did independent libraries, although all branches did not furnish the same services; in terms of quality, there seems to have been no significant difference. The range of services that depend heavily upon the book collections provided by independent public libraries and in Boston branches was comparable; in terms of quality, however, the branch services are assumed to have been inferior to the services of independent public libraries which depend heavily upon the book collections, because of the relative inadequacy of branch holdings, as shown in the earlier chapters on qualitative and quantitative analysis of library collections.

CHAPTER IX. USE PATTERNS IN STATIONARY BRANCH LIBRARIES IN BOSTON

In spite of the shortcomings of attendance data, circulation figures, and reference statistics—which were discussed in Chapter III on methodology—an examination was made of available attendance, circulation, and reference information to determine use patterns in stationary branch libraries.

A survey of attendance was conducted by the Division of Home Reading and Community Services in each of the twenty-six branches between October 15 and October 31 (in the case of all branch libraries except one, which terminated the study on October 27, and three other branches, which collected data through November 3), 1962. The number of patrons present every hour on the half-hour during what was assumed to be a representative fifteen-day period was recorded; it was thought that the hourly spot checks reflected the total attendance picture. Subsequent visits to branch libraries in the spring of 1963 indicated that the attendance reported in the survey was probably overstated, since librarians sometimes reported the number of patrons entering the libraries throughout the hour rather than the number actually present on the half-hour; nevertheless, the survey data were analyzed.

With the exception of one branch, all stationary branch libraries were closed to the public on Monday and Thursday mornings. Three of the branches conducted group programs—class visits, pre-school story hours, and meetings of mothers' groups—while barring the general public on closed mornings, but the other closed units admitted no patrons whatsoever. Disregarding Saturday mornings, on the three weekday mornings when all branches were open to the public, there were typically fewer than fifteen patrons present at any one time, as shown in Table 36; between nine and ten o'clock, there were usually fewer than five users.

TABLE 36  
MEAN NUMBER OF PATRONS IN STATIONARY BRANCH LIBRARIES OF THE  
BOSTON PUBLIC LIBRARY, OCTOBER 15-31, 1962, BY DAYS  
OF THE WEEK AND BY HOURS OF THE DAY

Day	Hour											
	9:30	10:30	11:30	12:30	1:30	2:30	3:30	4:30	5:30	6:30	7:30	8:30
Monday					10	24	66	54	18	20	30	21
Tuesday	4	12	7	7	11	25	65	49	16	20	30	20
Wednesday	5	9	8	6	8	22	64	47	15	15	24	17
Thursday					10	26	73	48	17	17	28	18
Friday	3	14	11	6	10	17	44	33	11			
Saturday	7	17	24	14								

Note: Means are rounded to the nearest whole numbers.

In the afternoons, attendance rose sharply, as depicted graphically in Fig. 8, after schools were closed for the day; during the peak period between three and four o'clock, attendance averaged sixty-two, or more than five times the highest typical morning attendance of twelve. After dropping off during the dinner hour, attendance again rose in the evening, reaching the typical high of twenty-eight, or less than half of the afternoon peak.

Although the figures in Table 36 and Fig. 8 do not distinguish between types of users by age group, data provided by four of the twenty-six stationary branches did separate adults, young adults, and children into separate categories. From this information, and from all-day visits made in the spring of 1963, it is apparent that the morning users of branch libraries were principally adults, except when

class visits to the library or preschool story hours were scheduled; in the morning hours, elderly persons and housewives were frequently observed browsing and reading, without the aid of library staff.

During the afternoon hours, the principal users of branch libraries were children, the ratio of children to young adults to adults during the peak period being about eight to three to two. The amount of professional assistance sought by users seemed to be directly related to school assignments, students without specific assignments doing more browsing on their own. Adult users during afternoon hours made few requests for professional assistance.

Seventeen of the twenty-six branch libraries were open four evenings a week and the rest—with one exception—were open two evenings a week. During evening hours, the children's service areas in many branches were closed; in the branches where they were open, use by children was generally small when compared to adult and young adult use. In many units, youngsters were observed using the libraries as study halls. Typically, the ratio of adults to young adults in branch libraries during evening hours was about four to three.

On the basis of attendance data alone, it seems fair to conclude that the typical weekday morning in a stationary branch library was characterized by a lack of requests for personal service from patrons, unless a group program had attracted users. A typical Saturday morning, however, was different because schools were not in session and many businesses were closed. As Table 36 reveals, more patrons visited branch libraries on Saturday mornings than on any other mornings. Saturday mornings were typically as busy as Wednesday evenings, the peak number of patrons at any one time not exceeding twenty-four; the big difference was that the users were predominantly children rather than adults and young adults. Observations in branch libraries revealed that children seem to demand more personal assistance from professional staff than any other age group.

Figure 8: Mean Number of Patrons in Stationary Branch Libraries of the Boston Public Library on a Typical Weekday During the Period from October 15 through October 31, 1962, by Hours of the Day

Note: Data for Saturdays were omitted and closed hours were excluded from the computations

Circulation figures for 1961 indicated that the stationary branches in Boston lent 2,152,523 of the 3,040,616 books circulated by the library system as a whole; branch loans for home use amounted to nearly 71 percent of the total annual circulation. The median branch circulation was 73,206, with the range from 36,152 to 169,016, as Table 37 reveals. On a per capita basis, the branch circulation figures varied from 1.2 to 5.9, with a median of 3.4.

Median	73,206	24,001	3.4

Data from Division of Home Reading and Community Services, Boston Public Library.

As a comparison, all of the free public libraries in Massachusetts serving populations of from 20,000 to 100,000 persons lent between 75,924 and 857,222 volumes in 1961, with a median of 286,915; on a per capita basis, the median was 7.2 and the range was from 1.9 to 16.1. The median circulation in 1961 for all libraries in municipalities of between 20,000 and 30,000 population was 216,387, with the range from 79,801 to 445,566; these libraries lent between 3.9 and 16.1 volumes per capita, with a median of 8.6 volumes per capita. It seems that the independent libraries circulated, on the average, more than three times as many books as the typical branch; on a per capita basis, this amounted to more than twice as many volumes as the average branch lent. Data for the independent libraries are shown in Table 38.

Circulation data were not collected by agencies of the Boston Public Library according to the age groups of the borrowers, i.e., adults, young adults, and children. Statistics by age groups have been obtained by counting the number of items circulated on each of the three types of borrower's cards during what were considered to be representative periods: July 25-30, 1960, January 23-28, 1961,

<sup>a</sup>Six municipalities in this population range had more than one independent library and one other town provided no municipal appropriation to the library; these seven were omitted from this table to avoid errors due to inclusion of incomparable data.

Data from: Massachusetts. Department of Education. Division of Library Extension. Seventy-third annual report of the Board of Library Commissioners for the year ending June 30, 1962. [Boston, 1963] pp. 16-21.

April 24-29, 1961, July 22-27, 1962, January 21-26, 1963, and April 22-27, 1963; because of blurred film records, equivalent weeks were substituted in some cases. Although the type of borrower's card used does not necessarily indicate the age group of the borrower (for example, all members of a family might have used the same card) it is assumed that the type of borrower's card used is a rough measure of the age group of the borrower.

It was found that during the summer period, about 44 percent of the books lent were borrowed on adult cards, 15 percent on young adult cards, and 41 percent on children's cards, as shown by Table 39, which is based upon data compiled by the Division of Home Reading and Community Services (shown as Appendix IV to this study). During the winter period, about 36 percent of the books issued were circulated on adult cards, 14 on young adult cards, and 50 percent on children's cards, while during the spring period, about 37 percent were lent on adult cards, 13 percent on young adult cards, and 50 on children's cards. In the course of the school year, children probably borrowed half of the books circulated by stationary branches of the Boston Public Library; during the summer, adults replaced children as the principal borrowers, while the rate of young adult circulation varied by only a few percentage points.

TABLE 39

MEDIAN PERCENTAGE OF BOOKS CIRCULATED ON ADULT, YOUNG ADULT, AND CHILDREN'S CARDS BY STATIONARY BRANCHES OF THE BOSTON PUBLIC LIBRARY, BY TIME PERIODS

Time Period	Median Percentage of Books Issued on Adult Cards	Median Percentage of Books Issued on Young Adult Cards	Median Percentage of Books Issued on Children's Cards	Total Percentage <sup>a</sup>
July 25-30, 1960	46.8	14.4	39.7	100.9
July 22-27, 1962	40.5	16.0	42.5	99.0
Average	43.7	15.2	41.1	100.0
January 23-28, 1961	37.0	14.5	49.5	101.0
January 21-26, 1963	35.5	13.0	50.5	99.0
Average	36.3	13.8	50.0	100.1
April 24-29, 1961	39.0	13.0	48.3	100.3
April 22-27, 1963	34.0	13.2	51.8	99.0
Average	36.5	13.1	50.1	99.7

<sup>a</sup>All figures in these columns do not equal 100.0 percent because of rounding errors and the fact that values in the other columns were computed independently of each other.

Data from Appendix IV.

At the same time that the survey of attendance was being conducted in branches of the Boston Public Library, a count was being made of the number of questions asked at public service desks. A form devised by the Division of Home Reading and Community Services (shown as Appendix III to this study) divided "reference" questions into (1) those answered in less than ten minutes, (2) those answered in ten to thirty minutes, and (3) those that required more than thirty minutes of working time; there were also spaces in which to indicate whether requests were filled or unfilled. Questions of book selection were divided into (1) simple author location, (2) subject list consultation, and (3) advisory service, including preparation of reading lists. On the form there were also spaces in which to indicate whether the card catalog was consulted through author, title, or subject approaches and whether information was given over the telephone. On visits to branches, the investigator was told by some librarians that they found the data form difficult to use, with the result that the data obtained may lack reliability.

As Table 40 shows, the median number of questions submitted during a "typical week," i.e., the average of three weeks, October 15-31, 1962, at stationary branch libraries in Boston was 403.4, with the range from 217.8 to 1,196.1. The median number of weekly questions answered at adult service

Total <sup>c</sup>	2,570.6	3,186.5	6,704.5	12,818.4
Median	77.3	127.6	198.2	403.4

<sup>a</sup>Average of three weeks, October 15-31, 1962.

<sup>b</sup>Data by desk not available.

<sup>c</sup>Totals for adult desk plus young adult desk plus children's desk do not equal totals for all desks because Hyde Park branch did not furnish data by age groups.

points was 77.3, with the range from 19.1 to 292.9; the median number at young adult service points was 127.6, with the range from 34.8 to 246.5; and the median number at children's service points was 198.2, with the range from 78.3 to 786.5. Of the questions presented, 19.2 percent were asked at adult service desks, 31.6 percent at young adult service desks, and 49.1 percent at children's service desks.

When the questions were divided into those which usually require professional assistance to be answered, (viz., those in the categories of reference and advisory service requests on the data form), and those that it is assumed may be answered by nonprofessional staff, (viz., those involving the location of specific books by author or title), it was found that of the 12,818.4 questions submitted during a "typical week" at all stationary branches, 5,754.4 questions, or about 44 percent, were probably requests for professional service, while the rest might have been answered by clerks. With regard to questions thought to require professional assistance, the median number at adult service points was 43.3, with the range from 5.5 to 177.3; the median number at young adult desks was 67.5, with the range from 12.6 to 151; and the median number at children's service points was 75.3, with the range from 18.7 to 268.3. For all reference and advisory questions, the median was 173.3 per week, with the range from 36.8 to 628.1. Not only did children appear to ask the most questions, but they appeared to ask the most questions requiring professional assistance.

On the basis of attendance statistics, circulation figures, and a count of questions asked by patrons, children were the principal users of the branches of the Boston Public Library. The central library at Copley Square is predominantly a library for adults; less than 10 percent of the books borrowed from the central library are issued on children's cards.

During National Library Week, April 8-14, 1962, Bostonians visiting their neighborhood libraries were asked to fill out a "Library-User Questionnaire," which did not have to be signed and which consisted largely of multiple-choice questions. The purpose of the form which was for adults only, was to indicate the needs and interests of users of the neighborhood libraries so that better service might be provided. These questionnaires were not distributed to the public in a manner intended to yield a random distribution; therefore, generalizing from the responses is questionable. Nevertheless, the completed questionnaires were analyzed to shed some light on the question of library use. At all branches, some patrons reported that they used other libraries in addition to the neighborhood library they were visiting; they were apparently willing to travel to find the materials they needed.<sup>1</sup>

From January 19 to February 8, 1959, the Boston Public Library surveyed the people entering the central library at Copley Square and the Kirstein business branch to determine the extent of nonresident use of the Division of Reference and Research Services. A random sample of the users was not obtained in this study either, because there were many people who completed more than one questionnaire. The results of this survey nevertheless indicated that over 30 percent of the users traveled from sections of Boston beyond Back Bay, the section in which the central library is situated, while another 50 percent of the users resided outside the Boston city limits. Of the respondents to the questionnaire, about half reported that they used the central library because they believed it to be the only location of desired information.<sup>1</sup>

In summation, the central library in Boston was the only public library in the city that served primarily adults; young adults who were serious students had to use it, too. Adults and young adults were willing to travel for high quality collections and services. The stationary branches were principally children's libraries; the collections for adults and young adults constituted little more than browsing collections.

On typical mornings when group programs were not scheduled, only a handful of browsers used the branch libraries. In the afternoons, school children were predominant among the patrons, asking many questions and borrowing heavily. During evening hours, adults and young adults visited branch libraries—the former group most frequently to browse and borrow books and the latter group most frequently to do school assignments and to socialize—as all-day observations in branches have shown. Sufficient use data from independent public libraries serving populations of 20,000 to 100,000 persons were not available for purposes of comparison.

## CHAPTER X. STAFFING PATTERNS IN STATIONARY BRANCH LIBRARIES OF THE BOSTON PUBLIC LIBRARY

In terms of full-time equivalents, as of December 31, 1961, the stationary branch libraries in Boston had an average staff of about seven employees, excluding maintenance workers. Of the seven employees, as Table 41 indicates, three were classified as professional librarians (although not all professional librarians in the Boston Public Library had received academic training in library service), one was in the pre-professional category, and three were classified as nonprofessional library employees—half of them full-time library assistants and half of them part-time library aides. The number of professional staff members in the twenty-six stationary branches ranged from two to six, the number of pre-professional staff from none to three, and the number of library assistants and library aides (in full-time equivalents) from one to six.

The ratio of professional librarians to other library employees, excluding maintenance workers, as of December 31, 1961, was typically three to four in branch libraries of the Boston Public Library. When pre-professional staff were placed in the same category as professional staff, the ratio became four to three. The fact that pre-professional employees were assigned the same duties as professional employees in the lower ranks permitted the consolidation of professional and pre-professional classes for purposes of analysis. As Table 41 shows, nonprofessional staff outnumbered professional staff at seven branch libraries while there were more professional staff than nonprofessional staff at nineteen neighborhood outlets.

Nonprofessional tasks, such as the accessioning of books, lettering, filing, typing, stamping of forms, the lending and checking-in of materials, the preparation of simple statistical reports, mending, the preparation of overdue records, shelving, and the reading of shelves, must be completed for a library to function properly. Because of a shortage of nonprofessional employees in branch libraries, it was necessary for professional staff to perform nonprofessional duties. On all-day visits to the branches made during the spring of 1963, librarians were observed doing work that clerks could have completed if they were available; professionals in some units were performing tasks identical to those being performed in other branch libraries by nonprofessional employees. To have professional staff perform the same tasks as nonprofessional staff members is to waste professional skills.

In the previous chapter, it was demonstrated that little use was made of neighborhood outlets by the public during morning hours on weekdays unless group programs were scheduled. On all weekday mornings—whether the branches were open or closed to the public—staff were present, as shown in Table 42; data were collected—without a division being made between professional and nonprofessional staff—during the latter half of October, 1962, at the same time that the attendance and reference surveys were being conducted. The difference, in terms of the number of staff present, between an open morning and a closed morning was typically one bibliothecal employee.

Visits to branches on Monday and Thursday mornings when libraries were closed to the public revealed that staff used these mornings to perform duties that required absence from public service desks, such as preparation of overdue notices, mending, preparation of simple statistical reports, and accessioning of books; only three branch libraries scheduled class visits to the library, pre-school story hours, or meetings of mothers' groups for closed mornings. Since all of the activities carried on while branches were closed to the public could have been carried on during open hours—as they were in most branches visited—assignment of staff to branches on closed mornings seemed unnecessary; the public would probably have received better service had the staff working on closed mornings been assigned to work during open hours.

Because users on open mornings were principally adults who sought no professional assistance, there appeared to be no reason for the scheduling of professional staff during these hours, unless group programs were planned for this age group. Although assigned to work morning hours, children's librarians did not have to be present for coverage since most youngsters were in school; children's workers could have been visiting classes during these hours.

Friday	3	4	4	2	2	4	7	7	5			
Saturday	5	5	5	5								

Notes: In East Boston branch library, the study was terminated on October 27; and in Allston, Mount Bowdoin, and South End branch libraries, it was continued through November 3.

Means are rounded to the nearest whole numbers.

Figure 9: Mean Number of Patrons and Mean Number of Staff in Stationary Branch Libraries of the Boston Public Library on a Typical Weekday During the Period from October 15 through October 31, 1962, by Hours of the Day

Note: Data for Saturdays were omitted and closed hours were excluded from the computations.

As Fig. 9 shows, on a typical weekday morning, the average branch staff consisted of three employees; spot checks at various branches in the spring of 1963 indicated that these three employees were usually two professionals and a library assistant. At 10:30 a.m., a peak hour, the ratio of patrons to staff was typically four to one and the ratio of patrons to librarians was six to one.

During the afternoon peak period, the average staff consisted of seven persons—three professionals, two library assistants, and two part-time library aides, according to spot checks. As Fig. 9 indicates, the ratio of patrons to staff was about nine to one at that time and the ratio of patrons to librarians was nearly twenty-one to one.

In the evening, the average branch had four staff members; spot checks revealed that these were usually one professional, one library assistant, and two library aides. At 7:30 p.m., a peak hour, the patron-to-staff ratio was typically seven to one, as Fig. 9 demonstrates, while the ratio of patrons to professionals was twenty-eight to one.

On Saturday mornings, the typical branch staff consisted of five persons, as shown in Table 42. Table 36 indicates that, on the average, the largest number of persons on Saturday mornings was twenty-four. Therefore, the ratio of patrons to staff was less than five to one. Since spot checks revealed that the staff consisted of one professional and four library aides in many branches, the ratio of patrons to professionals was twenty-four to one.

All-day observations in branch libraries showed that all employees, not only professional staff, were being under-utilized during slow hours. Clerks were seen sitting at charging desks reading novels while waiting for books to be charged out or returned. Part-time library aides were observed talking to their friends after having shelved the books that were returned. Librarians were observed drawing posters and cutting out paper decorations for displays. If the libraries had been closed during these slow periods, the public would not have suffered greatly and the Boston Public Library would have been able to decrease its personnel budget.

The large number of professional staff in branch libraries in Boston resulted from the policy decision that experienced librarians had to be present in all library units during all hours that the units were open to the public. It was thought that professional librarians were the only employees who could assume responsibility for the operation and management of library outlets. During a visit to the stationary branch library which, in 1961, was the third largest branch in terms of annual circulation (Codman Square branch), a nonprofessional library assistant was left in charge of the unit for forty minutes in the morning; she was observed tending the circulation desk, finding specific titles for patrons, filling out reserve cards for patrons, and supplying directional information. Based upon this observation, it appeared as though trained nonprofessional staff could supervise the functioning of library outlets when the need for professional services was slight; if professional aid were required, a telephone call to the nearest library unit manned by professional staff could have summoned it, or the patron in need—if he were an adult or young adult—could have traveled to the professionally-staffed unit. It has been found that adult patrons were willing to travel to obtain superior library service at the central library.

Formulas for staffing branch libraries have been provided by recognized authorities in the library field; these formulas are based upon a mixture of opinion and experience. Martin recommends that there be six staff members for each 100,000 circulation, which amounts to 16,667 volumes issued per staff member.<sup>1</sup> Under this formula, Boston's stationary branches had more than sufficient staffing at the end of 1961, as Table 43 indicates, for the circulation per staff member varied from 5,738 to 16,556, with a median of 10,681; to meet Martin's standard, the branches would have required 129 staff members rather than the 187.5 actually employed. The neighborhood outlets would have appeared even more overstaffed had the rule-of-thumb for manning branch libraries stated by Wezeman been adopted: "One full-time staff member for each 20,000 annual circulation."<sup>2</sup>

All staffing formulas are only rough measures. Many variables, such as the socioeconomic characteristics of the population served, the program of services, attendance, circulation, physical facilities, the budget, the availability of suitable recruits, and the attitudes of the community, affect staffing. Management studies are needed so that proper manning tables may be established.

In the assignment of staff to branch libraries in Boston, the goal had been to provide sufficient professional staff to handle any and all situations that might arise. This policy resulted in a surplus of professional staff, especially during morning hours. Coupled with the excess of professional staff was a deficiency of nonprofessional employees, especially during afternoon hours when librarians were frequently observed handling circulation routines. It is desirable that library tasks be divided into professional and nonprofessional duties; these jobs should then be assigned to appropriate personnel for completion.

TABLE 43

ALLOCATIONS OF BIBLIOTHECAL STAFF IN BRANCH LIBRARIES OF THE BOSTON PUBLIC LIBRARY, AS OF DECEMBER 31, 1961, AND IN ACCORDANCE WITH THE MARTIN FORMULA<sup>a</sup> (IN FULL-TIME EQUIVALENTS)

Branch Library	Total Staff 1961	Circulation per Staff Member, 1961	Total Staff, if Circulation per Staff Member = 16,667	Net Change

<sup>a</sup>Six staff members per 100,000 circulation, or 16,667 books issued per staff member.

CHAPTER XI. THE COSTS OF BRANCH LIBRARY SERVICE IN BOSTON

Operating expenditures for stationary branch library service in Boston during 1961—including those for library materials, salaries, utilities, repairs, and rent (if any), but omitting those for services provided to branch libraries by departments at the central library (such as acquisition and processing of library materials, maintenance of registration records, personnel administration, public relations, interlibrary loans, and preparation of booklists by specialists in reading guidance) ranged from \$25,629 to \$61,966 with a median of \$45,398. On a per capita basis, operating expenditures for branch libraries (excluding those for services supplied by the central library) varied from ninety-five cents to \$3.62, with a median of \$2.02. As a whole, the Boston Public Library system spent \$5.17 per capita. Table 44 shows annual operating expenditures for 1961 by branch libraries.

TABLE 44  
ANNUAL OPERATING EXPENDITURES FOR 1961 BY BRANCH LIBRARY  
OF THE BOSTON PUBLIC LIBRARY

Branch Library	Expenditures <sup>a</sup>	Estimated Population Served, 1960	Expenditure per Capita
Adams Street	\$59,242	21,615	\$2.74
Allston	43,375	21,984	1.97
Brighton	41,649	30,108	1.38

West Roxbury	61,252	25,328	2.42
Median	\$45,398	24,001	\$2.02

<sup>a</sup>Expenditures from trust funds and gifts are omitted.

Data from Division of Business Operations, Boston Public Library.

To measure the efficiency of a branch library, Wheeler and Goldhor recommend that the cost per circulation be calculated. "At 1961 prices," they state, "any branch (or other extension agency) whose direct costs (salaries, books, utilities, repairs, etc.) exceed 25 cents per circulation is not an efficient agency."<sup>1</sup> As Table 45 indicates, the unit cost for circulating books in Boston's twenty-six stationary branch libraries varied from thirty-five cents to \$1.16 in 1961, with a median of sixty cents. By the Wheeler and Goldhor standard, all of Boston's neighborhood outlets were operated inefficiently during 1961.

TABLE 45

COST PER CIRCULATION IN BRANCH LIBRARIES OF THE BOSTON PUBLIC LIBRARY, 1961

Branch Library	Operating Expenditures <sup>a</sup>	Circulation	Cost per Circulation
Adams Street	\$59,242	126,492	\$ .47
Allston	43,375	63,748	.68
Brighton	41,649	77,440	.54

Uphams Corner	46,672	96,252	.48
Washington Village	36,584	78,270	.47
West Roxbury	61,252	149,000	.41
Median	\$45,398	73,206	\$ .60

<sup>a</sup>Expenditures from trust funds and gifts are omitted.

Data from Division of Business Operations, Boston Public Library.

When the cost per circulation was computed for all independent public libraries in Massachusetts—and this included the costs of acquisition and processing of library materials, maintenance of registration records, personnel administration, public relations, interlibrary loans, and other items not charged against Boston's branch libraries—it was found that the cost per circulation varied from sixteen cents to \$1.24 in 1961 for libraries serving from 20,000 to 100,000 persons, with a median of forty cents; for public libraries serving from 20,000 to 30,000 persons, the median cost per circulation was thirty-nine cents, while the range extended from twenty-five to fifty-four cents. On the average, all of the independent public libraries in Massachusetts issued books at a much lower cost per unit than stationary branch libraries in Boston. Data for independent libraries are shown in Table 46.

According to Wheeler and Goldhor's standard, the stationary branch libraries in Boston were not operated efficiently; nor were they operated as efficiently as independent libraries serving comparable

Median	\$116,110	292,041	\$ .40

<sup>a</sup>Six municipalities in this population range had more than one independent library and one other town provided no municipal appropriation to the library; these seven were omitted from this table to avoid errors due to inclusion of incomparable data.

Data from: Massachusetts. Department of Education. Division of Library Extension. Seventy-third annual report of the Board of Library Commissioners for the year ending June 30, 1962. [Boston, 1963] pp. 16-21.

population groups. This was probably due to the fact that each of the small branches was attempting to provide the full range of services for all age groups. Because these neighborhood outlets were not used much by adults and young adults, as compared with children, trying to supply materials and staff to satisfy adequately the library needs of adults and young adults evidently was too costly. In the next chapter, the possibility of serving all age groups more efficiently and adequately through a small number of large outlets designed primarily to satisfy adult and young adult needs and a large number of small outlets designed primarily to satisfy children's needs will be explored to determine if unit costs can be reduced while the quality and availability of library service are increased.

## CHAPTER XII. SOME ALTERNATIVES FOR PROVIDING ADEQUATE LIBRARY SERVICE TO A LARGE CITY, INCLUDING ESTIMATES OF COSTS

In a large city such as Boston—as this study has shown—the typical stationary branch library did not in 1963 provide adult and young adult users with the same level of service as was provided by the main library in the average small city or town in Massachusetts which served a population comparable in size to that served by a branch library. Only those Bostonians who patronized the central library received adequate public library service, i.e., a level of service at least equal to the level of service offered by central libraries in independent cities and towns in Massachusetts with populations ranging between 20,000 and 100,000 persons.

The outstanding feature distinguishing the average independent library in Massachusetts from the typical stationary branch library in Boston was the superiority of the former library's book collections for adults and young adults in terms of quantity and quality, with the concomitant superiority of book-related reader services. At the end of 1961, the median number of adult and young adult books held in stationary branch libraries was roughly 12,000, or 60 percent of the typical branch collection of roughly 20,000 volumes. Precise figures on the number of volumes for adults and young adults in small independent libraries were not available, but the median book collection in autonomous libraries serving between 20,000 and 30,000 Massachusetts residents in 1961 was about 69,000 volumes, or three and one-half times the typical branch collection, while for all independent libraries serving between 20,000 and 100,000 persons in 1961 the median collection was about 110,000 volumes, or five and one-half times the typical branch collection. If one assumes that children's books constitute twenty-five percent of the total number of volumes in the library collection, in accordance with the 1943 standard for public libraries,<sup>1</sup> the average independent library serving between 20,000 and 30,000 persons holds about 52,000 volumes for adults and young adults while the typical library serving a population of 20,000 to 100,000 persons holds about 83,000 adult and young adult books. The collection of adult and young adult books in the typical Boston branch was only 12,000 volumes, as stated above.

The median number of children's books in stationary branch libraries in Boston in 1961 was roughly 8,000 volumes. The central library in Boston, with a higher quality children's collection than that found in any of the four independent libraries visited, held about 14,000 juvenile books. The stationary branch libraries provided generally adequate collections and services for children who were able to visit the libraries.

One approach to the problem of providing adequate public library service to all residents of Boston would involve bringing book collections in all stationary branches up to the level of main libraries in small cities and towns in Massachusetts. If each of the twenty-six branches, which served an average of about 24,000 Bostonians in 1963, held book collections of 70,000 volumes—55,000 adult and young adult books and 15,000 children's books—the same quality of library service provided by independent libraries in the 20,000 to 30,000 population class could have been offered by these neighborhood outlets. With a bibliothecal staff (in full-time equivalents) of seven—three professionals, two full-time nonprofessional library assistants, and seventy hours (the equivalent of two full-time staff) of part-time library aides—each branch could have been open to the public sixty-three hours per week (10 a.m. to 9 p.m. Monday through Friday, and 10 a.m. to 6 p.m. on Saturday) during most of the year, just as the median independent library serving a population between 20,000 and 30,000 persons was in 1961, and could have offered the same level of service as small independent libraries; in fact, the average stationary branch had a bibliothecal staff (in full-time equivalents) of seven—four professionals and a total of three nonprofessionals—and was open to the public fifty-three hours a week.

To provide adequate service, each of the strengthened branches would have required seating space for seventy-five adult and young adult readers and fifty juvenile readers, a meeting room seating one hundred persons, and sufficient space for shelving, staff, and other areas. The following space requirements are considered reasonable:

<u>Quantity</u>	<u>Description</u>	<u>Square Feet per Unit</u>	<u>Total (in Square Feet)</u>
55,000	Shelving space for adult and young adult books	1/15	3,667
15,000	Shelving space for children's books	1/20	750
75	Reading space for adults and young adults	35	2,625
50	Reading space for children	25	1,250
7	Space for staff	100	700
100	Seating space in meeting room	10	1,000
	Miscellaneous		<u>1,008</u>
	Total space required (in square feet)		11,000

At a unit cost of \$20 per square foot, a new branch with 11,000 square feet of floor space would cost \$220,000 to construct, excluding the cost of land. Furniture and equipment would probably cost another \$25,000. At a unit cost of \$6 per volume (including ordering and processing costs), 55,000 adult and young adult books would require \$330,000; and at a unit cost of \$4 per volume (including ordering and processing costs), 15,000 children's books would cost \$60,000. The total investment in each new such branch library would be about \$635,000, excluding the cost of land. The establishment of twenty-six new branches, at \$635,000 per unit, would total \$16,510,000, exclusive of land costs.

Seven of the twenty-six stationary branches, including one with more than 11,000 square feet of floor space, were located in 1963 at some of the first twenty-seven sites suggested for library outlets in Boston. Assuming the floor space in these seven outlets—plus the furniture, equipment, and book stock of all twenty-six existing branches—could be fully utilized in the creation of the proposed system of twenty-six new branches in addition to the central library, the total capital investment in the new system, excluding land costs, would be reduced to \$12,601,752. Of this amount, \$4,826,920 would be for 241,346 additional square feet of floor space (at \$20 per square foot), \$6,681,708 would be for 1,113,618 additional books for adults and young adults (at \$6 per volume, including ordering and processing costs), \$693,124 would be for 173,281 additional books for children (at \$4 per volume, including ordering and processing costs), and \$400,000 for additional furniture and equipment. Since the establishment of twenty-six new branches would require a capital outlay of about \$16,510,000, utilization of existing physical plants, furniture, equipment, and collections would result in savings of about \$3,908,248.

In addition to the capital investment, there are current operating expenditures. Although the capital outlay is shown in prices as of 1964, the annual operating costs will be shown for the various proposed systems in terms of prices paid by the Boston Public Library in 1961; this will permit comparisons to be made between the schemes offered for consideration and the actual branch system in Boston, for which 1961 data were the latest available. At 1961 prices, each new branch library would have annual operating expenditures of approximately \$64,000, or about \$19,000 more than the median 1961 operating expenditures for stationary branches in Boston, \$45,398.31. These operating expenses exclude the costs of ordering and processing materials, which—although included in the capital outlay for building the original collections—are charged to the central library in annual operating budgets. The \$64,000 yearly operating costs for each strong branch library would be divided as follows:

Staff (in full-time equivalents, at about average Boston Public Library salary rates for 1961)		
Branch librarian	1 at \$7,000 each	\$ 7,000
Professional librarian	2 at \$5,500	11,000
Library assistant	2 at \$3,000	6,000
Library aide	2 at \$1,750	3,500
Building custodian	1 at \$3,800	<u>3,800</u>
Total		\$31,300
Library materials (at about average 1961 costs, excluding the costs of ordering and processing)		
Adult and young adult books	5,000 at \$3.50	\$17,500
Children's books	1,500 at \$2.00	3,000

Periodical subscriptions	300 at \$5.00	1,500	
Audio-visual materials		<u>500</u>	
Total			\$22,500
Other operating expenditures			<u>\$10,200</u>
Grand Total			\$64,000

At the rate of \$64,000 per unit per year, the annual operating expenditures for twenty-six strong branch libraries would be \$1,664,000, exclusive of the costs of ordering and processing materials.

While strengthening the existing number of stationary branches would raise the quality of children's service in neighborhood outlets to the level of service in independent public libraries serving 20,000 to 100,000 persons, this would not be high enough in either case because of the accessibility requirements of children. Even with twenty-six strengthened branch libraries, youngsters living more than half a mile from one of the stationary outlets would not be receiving adequate public library service. In addition to the twenty-seven outlets in the city of Boston that provided the full range of services to children in 1963, at least thirty-three more units would be required in order to guarantee that no child has to walk more than half a mile to obtain all the library services he needs. A minimum of sixty units would be necessary, as was demonstrated in Chapter V. If the traditional approach were followed and all sixty stationary outlets were to offer adequate public library service to adults, young adults, and children, the costs would indeed be high. With the existing central library as one outlet—at \$635,000 per unit, the capital outlay for fifty-nine strong branches would be \$37,465,000, exclusive of the cost of land; and at \$64,000 per unit per year, the total annual operating expenses, exclusive of the ordering and processing costs borne by the central library, would amount to \$3,776,000 for fifty-nine stationary branches.

Fifteen of the 1963 branch locations have been judged suitable as sites for stationary library outlets. Assuming that the floor space in these fifteen outlets—plus the furniture, equipment, and book stock of all twenty-six branches—could be fully utilized in the creation of the proposed system of fifty-nine strong branches in addition to the central library, the total capital investment in the new system, excluding land costs, would be reduced to \$32,537,192. Of this amount, \$11,047,360 would be for 552,368 additional square feet of floor space (at \$20 per square foot), \$17,571,708 would be for 2,928,618 additional books for adults and young adults (at \$6 per volume, including ordering and processing costs), \$2,673,124 would be for 668,281 additional books for children (at \$4 per volume, including ordering and processing costs), and \$1,225,000 for additional furniture and equipment. Since the establishment of fifty-nine new strong branches would require a capital outlay of about \$37,465,000, utilization of existing physical plants, furniture, equipment, and collections would result in savings of about \$4,927,808.

The possibility of strengthening all twenty-six branch libraries in Boston to the point where they would be comparable to small independent libraries in Massachusetts in terms of collections and services has been discussed. Since adults and young adults can easily travel up to two miles to reach a public library, only eight strong stationary units (shown as locations numbered one through eight in Fig. 6) are needed to provide all members of these age groups with effectively equal access to library service. In addition to these eight regional libraries, many small neighborhood libraries would be necessary to provide service primarily to children—but also to adults and young adults who visit the library for popular reading on a casual basis.

If a system of regional libraries were established each regional library would provide the full range of services for adults, young adults, and children; it would be the equivalent in terms of collections and services of the typical main library in Massachusetts municipalities with 20,000 to 100,000 inhabitants. Neighborhood libraries would provide the full range of services for children—and only lending service, interlibrary loan service, and reserve book service for adult and young adult users; the two older age groups would normally be served by nonprofessional staff in neighborhood libraries. Reference service, reading guidance, and group services for adults and young adults would be offered only by professional librarians at the regional libraries, by telephone, or—through special arrangements—in neighborhood libraries. Normally the only professional staff in a neighborhood library would be a children's librarian. The selection and discarding of the popular collections of adult and young adult books in neighborhood libraries would be the responsibility of librarians specializing in work with adults and young adults who would be attached to regional libraries.

Neighborhood libraries would serve children primarily. Since youngsters are normally in school until after two o'clock on weekdays nine months of the year, there is no reason for a children's

librarian to be present for coverage during morning hours, unless class visits or preschool story hours are scheduled. The professional staff member could spend most of her mornings visiting schools. Saturday mornings are different because schools are closed and children visit the library, as they do on weekday afternoons. For the convenience of adult and young adult browsers, neighborhood libraries could be open during some morning and evening hours with nonprofessional library assistants in charge. The hours of service for the general public might be 2 p.m. to 9 p.m. on Mondays and Thursdays, 2 p.m. to 6 p.m. on Wednesdays, 10 a.m. to 6 p.m. on Tuesdays and Fridays, and 10 a.m. to 1 p.m. on Saturdays. In addition to these open hours, neighborhood libraries may be utilized on closed mornings and evenings for group programs. Three bibliothecal employees (in full-time equivalents)—a children's librarian, a library assistant, and thirty-five hours of part-time help—should be able to handle the workload during the thirty-seven hours of service in neighborhood libraries.

The regional libraries would be open to the public sixty-nine hours a week, 9 a.m. to 9 p.m. Monday through Friday and 9 a.m. to 6 p.m. on Saturday; this about equals the median number of hours of opening for independent libraries in Massachusetts serving populations of 20,000 to 100,000 persons in 1961. During all hours that regional libraries would be open, professional staff would be on duty. Group services for adults and young adults would be planned and carried out on a regional basis by librarians attached to the regional libraries. Each regional library would hold book collections of 110,000 volumes, 95,000 adult and young adult books and 15,000 children's books; this equals in size the median public library collection in 1961 of Massachusetts municipalities with 20,000 to 100,000 inhabitants. Excluding maintenance personnel, a staff of 9.5 employees (in full-time equivalents)—four professional librarians, including a children's worker, a specialist in reference service, a specialist in reading guidance, and a specialist in group services; three library assistants; and 87.5 hours of part-time library aides—would be given to each regional library. More than one of the professional librarians could be freed of coverage responsibilities so that visits to community groups, high schools, colleges, and neighborhood libraries might be made several times a week.

Seats for one hundred adult and young adult readers and fifty juvenile readers, a meeting room seating 150 persons, and sufficient space for shelving, staff, and other areas would be provided in each of the regional libraries. The following floor space would be required:

<u>Quantity</u>	<u>Description</u>	<u>Square Feet per Unit</u>	<u>Total (in Square Feet)</u>
95,000	Shelving space for adult and young adult books	1/15	6,333
15,000	Shelving space for children's books	1/20	750
100	Reading space for adults and young adults	35	3,500
50	Reading space for children	25	1,250
9.5	Space for staff	100	950
150	Seating space in meeting room	10	1,500
	Miscellaneous		<u>1,217</u>
	Total space required (in square feet)		15,500

None of the present branch library buildings has sufficient floor space to house one of the eight regional libraries, as Table 3 (see above) illustrates. Moreover, only two of the locations used in 1963 are among the first eight suggested sites. At a unit cost of \$20 per square foot, a new regional library building would cost \$310,000 to construct, excluding the cost of land. Furniture and equipment would probably cost another \$30,000. At a unit cost of \$6 per volume (including ordering and processing costs), 95,000 adult and young adult books would require \$570,000; and at a unit cost of \$4 per volume (including ordering and processing costs), 15,000 children's books would cost \$60,000. The total investment in each new regional library would be about \$970,000, excluding the cost of land. The establishment of eight new regional libraries, at \$970,000 per unit, would cost \$7,760,000, exclusive of land costs. The savings resulting from this utilization of existing physical plants, furniture, equipment, and collections will be discussed later.

Aside from the capital outlay, each new regional library would have annual operating expenditures of approximately \$85,000, exclusive of the costs of ordering and processing materials, which are charged to the central library. These yearly operating expenses would be divided as follows:

Staff (in full-time equivalents, at about average Boston Public Library salary rates for 1961)		
Branch librarian	1 at \$7,000	\$ 7,000
Professional librarian	3 at \$5,500	16,500
Senior library assistant	1 at \$3,500	3,500
Library assistant	2 at \$3,000	6,000
Library aide	2.5 at \$1,750	4,375
Building custodian	1 at \$3,800	<u>3,800</u>
Total		\$41,175
Library materials (at about average 1961 costs, excluding the costs of ordering and processing)		
Adult and young adult books	6,000 at \$3.50	\$21,000
Children's books	1,500 at \$2.00	3,000
Periodical subscriptions	300 at \$5.00	1,500
Audio-visual materials		<u>750</u>
Total		\$26,250
Other operating expenditures		<u>\$17,575</u>
Grand Total		\$85,000

At the rate of \$85,000 per unit per year, the annual operating expenditures for eight regional libraries would be \$680,000, exclusive of the costs of ordering and processing materials added currently.

Each of the neighborhood libraries would have a collection consisting of 12,000 children's books and 3,000 adult and young adult books for popular reading, as well as seating areas for fifty children and ten adults and young adults, a meeting room seating fifty persons, and sufficient space for shelving, staff, and other areas. The following space requirements are considered reasonable:

<u>Quantity</u>	<u>Description</u>	<u>Square Feet per Unit</u>	<u>Total (in Square Feet)</u>
12,000	Shelving space for children's books	1/20	600
3,000	Shelving space for adult and young adult books	1/15	200
50	Reading space for children	25	1,250
10	Reading space for adults and young adults	35	350
3	Space for staff	100	300
50	Seating space in meeting room	10	500
	Miscellaneous		<u>300</u>
	Total space required (in square feet)		3,500

All of the present branch library buildings except two, as shown in Table 3 above, have sufficient floor space to house a neighborhood library serving primarily children. At a unit cost of \$20 per square foot, a new neighborhood library building would cost \$70,000 to construct, excluding the cost of land. Furniture and equipment would cost another \$10,000. At a unit cost of \$4 per volume (including ordering and processing costs), 12,000 children's books would cost \$48,000; and at a unit cost of \$6 per volume (including ordering and processing costs), 3,000 adult and young adult books would cost \$18,000. The total investment in each new neighborhood library would be about \$146,000, excluding the cost of land.

Aside from the capital outlay, each new neighborhood library would have annual operating expenses of about \$21,000 exclusive of the costs of ordering and processing materials, which are charged to the central library. The yearly operating costs would be divided as follows:

Staff (in full-time equivalents, at about average Boston Public Library salary rates for 1961)		
Professional librarian	1 at \$5,500	\$5,500
Senior library assistant	1 at \$3,500	3,500
Library aide	1 at \$1,750	1,750
Building custodian	.5 at \$3,800	<u>1,900</u>
Total		\$12,650

Library materials (at about average 1961 costs, excluding the costs of ordering and processing)		
Children's books	1,300 at \$2.00	\$2,600
Adult and young adult books	400 at \$3.50	1,400
Periodical subscriptions	50 at \$5.00	250
Audio-visual materials		<u>100</u>
Total		\$ 4,350
Other operating expenditures		<u>4,000</u>
Grand Total		\$21,000

In place of the proposed system of fifty-nine strong branches in addition to the existing central library—which was discussed earlier—a system with twenty-six strong branches, thirty-three neighborhood libraries, and the central library may be substituted for greater economy. Such a scheme would still permit the city of Boston to provide relatively easy access to adequate public library service for all residents. In 1964, the establishment of this hybrid system would have required an investment of \$21,328,000, excluding the cost of land, as compared with a capital outlay of \$37,465,000 for the more traditional scheme, excluding land costs, if these systems were created *de novo*; twenty-six strong branches, at a unit price of \$635,000, would cost \$16,510,000 and thirty-three neighborhood libraries, at a unit price of \$146,000, would cost \$4,818,000, while fifty-nine strong branches would require an investment of \$37,465,000.

Fifteen of the branch libraries in 1963 were located at sites suggested for stationary library outlets. Assuming that the floor space in these fifteen units—plus the furniture, equipment, and book stock of all twenty-six operating branches—could be fully utilized in the creation of this hybrid system, the investment in this program would be reduced to \$16,859,752, excluding the cost of land, while the investment in the more traditional scheme (with utilization of existing facilities) would be reduced to \$32,537,192, excluding the land costs, in terms of 1964 prices. With both of these proposed systems, utilization of present physical plants, furniture, equipment, and collections would result in savings of less than \$5,000,000.

As for annual operating expenditures—at 1961 prices, the proposed hybrid system would cost \$2,357,000 per year, excluding the costs of ordering and processing materials, as compared with \$3,776,000 per year, excluding the same ordering and processing costs, for the system with fifty-nine strong branches; twenty-six strong branches, at \$64,000 per year, would expend \$1,664,000 annually and thirty-three neighborhood libraries, at \$21,000 per year, would expend \$693,000 annually, while fifty-nine strong branches would spend \$3,776,000 in the course of a year.

Returning to the regional library plan, one finds that a system having twenty-seven stationary outlets—the same number of outlets as served Boston in 1963—could be established with eight regional libraries, the existing central library, and eighteen neighborhood libraries; the central library would serve as a research library and as a neighborhood library for the immediate area. Such a scheme would allow the Boston Public Library to provide all residents with the same level of service as currently is offered to inhabitants of small cities and towns in Massachusetts with 20,000 to 100,000 population. The creation of this regional library system *de novo* in 1964 would have required an investment of \$10,388,000, exclusive of the cost of land, because eight regional libraries, at \$970,000 per unit, would cost \$7,760,000 and eighteen neighborhood libraries, at \$146,000 per unit, would cost \$2,628,000.

Since two of the branch library locations used in 1963 were among the eight suggested sites for regional libraries, and five others were among the first twenty-seven sites proposed for library outlets in Boston, utilization of existing facilities in the establishment of a regional library system seems feasible. Assuming that the floor space in these seven outlets—plus the furniture, equipment, and book stock of all twenty-six existing branches—could be fully utilized in the creation of this proposed system, the total capital outlay, excluding the cost of land, would be reduced to \$6,768,172 in terms of 1964 prices. Of this amount, \$3,104,340 would be for 155,217 additional square feet of floor space (at \$20 per square foot), \$2,986,708 for 497,618 additional adult and young adult books (at \$6 per volume, including ordering and processing costs), \$477,124 for 119,281 additional children's books (at \$4 per volume, including ordering and processing costs), and about \$200,000 for additional furniture and equipment. Since the establishment of eight new regional libraries and eighteen new neighborhood libraries would require a capital outlay of about \$10,388,000 in 1964, utilization of existing physical plants, furniture, equipment, and collections would result in savings of about \$3,619,828.

Aside from the capital outlay, the yearly operating expenditures—at 1961 prices—for a system of eight regional libraries, at \$85,000 per unit annually, and eighteen neighborhood libraries, at \$21,000 per unit annually, would amount to \$1,058,000, excluding the costs of ordering and processing materials. In 1961, the total operating expenditures for the twenty-six stationary branches of the Boston Public Library were \$1,190,571,<sup>2</sup> or about \$133,000 more than those for the proposed regional library system with as many outlets as the traditional branch system in Boston. Under this regional library plan, all residents—but especially adults and young adults—would have received much higher quality service than was available in 1963 at any of the branch libraries—and the cost would have been less than what was then spent for inadequate public library service.

A regional library system with twenty-seven stationary outlets could not provide all children in Boston with accessible library service, since a minimum of sixty units would be required. Eight new regional libraries, at \$970,000 per unit, fifty-one new neighborhood libraries, at \$146,000 per unit, and the existing central library could constitute the sixty-outlet system designed to give all Bostonians effectively equal access to public library service. The establishment of such a network *de novo* in 1964 would cost \$15,206,000, excluding the cost of land, since the regional libraries would cost \$7,760,000 and the neighborhood libraries would cost \$7,446,000. Utilization of existing physical plants, furniture, equipment, and collections could possibly reduce the capital investment, exclusive of land costs, to \$11,026,172 in terms of 1964 prices; of this amount, \$4,854,340 would be for 242,717 additional square feet of floor space (at \$20 per square foot), \$3,580,708 would be for 596,618 additional adult and young adult books (at \$6 per volume, including ordering and processing costs), \$2,061,124 would be for 515,281 additional children's books (at \$4 per volume, including ordering and processing costs), and about \$530,000 would be for additional furniture and equipment.

At 1961 prices, the annual operating expenditures for a system of eight regional libraries, at the yearly rate of \$85,000 each, and fifty-one neighborhood libraries, at the yearly rate of \$21,000 each, would be \$1,751,000, excluding the costs of ordering and processing materials.

With a library system consisting of twenty-seven stationary units, bookmobile service would have to be continued in order to reach residents of inaccessible areas. With a network of sixty units, however, bookmobile service may be eliminated. In 1961, the Boston Public Library spent \$127,882 on bookmobile service;<sup>2</sup> this money could have supported six neighborhood libraries.

As a recapitulation, Table 47 depicts the estimated requirements of several different approaches to the problem of providing adequate public library service to all residents of Boston in terms of the size of book collections, floor space, staff, and budget. Data for the central library are omitted, but since the data would have been constant in all cases, these omissions will not prevent comparisons being made between systems.

To provide Bostonians not using the central library with the same level of service as was offered in 1963 by independent libraries in Massachusetts serving 20,000 to 100,000 persons, any of the five proposed systems may be instituted. Since there were twenty-seven stationary outlets in Boston in 1963, it may be considered desirable to retain that number. If this is the case, the regional library (Plan 1) approach is preferable to the traditional library approach (Plan 2) because of savings in staff, capital outlay, and annual operating expenditures. The regional library plan with twenty-seven outlets requires nearly sixty fewer employees (in full-time equivalents) and about \$133,000 less in annual operating costs than the present branch library system in Boston, as Table 47 indicates.

To make adequate public library service easily accessible to children—as well as more easily accessible to all Bostonians—than it was to residents of independent municipalities in 1963, a minimum of sixty stationary outlets is required. It is apparent from data in the table that a regional library system with sixty outlets is less costly to establish, staff, and operate than either a traditional network with sixty units or a hybrid scheme consisting of twenty-six strong branches and 33 neighborhood libraries. Furthermore, Plan 1 (the regional library approach) is more than \$1,000,000 less costly to institute—both with and without utilization of existing physical plants, furniture, equipment, and collections—than Plan 2 (the traditional library approach), although the latter scheme has thirty-three fewer outlets. In spite of the fact that the sixty-unit regional library plan costs \$87,000 more to operate per year than the twenty-seven-unit traditional library system, the elimination of bookmobile service would more than make up for the difference. In terms of staff, both of the proposed twenty-seven-unit systems require fewer employees than were assigned to stationary branches at the end of 1961, while the suggested sixty-unit regional library plan calls for only 41.5 more staff (in full-time equivalents), as shown in Table 47.

All approaches to the problem of providing adequate public library service to all residents of a large city emphasize the importance of having adequate book collections: without these collections,

TABLE 47

ESTIMATED REQUIREMENTS OF SEVERAL PROPOSED LIBRARY SYSTEMS FOR THE CITY OF BOSTON IN TERMS OF THE SIZE OF BOOK COLLECTIONS, FLOOR SPACE, STAFF, CAPITAL OUTLAY, AND ANNUAL OPERATING EXPENDITURES<sup>a</sup>

Systems with 27 Station-ary Outlets (including the central library)	Total Volumes	Total Space (in Square Feet)	Total Bibliothecal Staff (in Full-Time Equivalents)
1. 26 strong branches	1,820,000	286,000	182.0
2. 8 regional libraries and 18 neighborhood libraries	1,150,000	187,000	130.0
Systems with 60 Station-ary Outlets (including the central library)			
3. 59 strong branches	4,130,000	649,000	413.0
4. 26 strong branches and 33 neighborhood libraries	2,315,000	401,500	281.0
5. 8 regional libraries and 51 neighborhood libraries	1,645,000	302,500	229.0

such services as reference and reading guidance cannot be properly given. As Table 47 indicates, all of the proposed systems require larger book supplies than were available in 1963 in Boston's twenty-six stationary branches. Accessibility is also an important consideration, since a strong central library cannot adequately serve adults and young adults living more than two miles away; well-located regional libraries or strong branch libraries can be used to serve outlying areas, i.e., areas more than two miles from the central library. For children, a library outlet should be within easy walking distance of their homes, which is assumed to be half a mile.

The most economical way for providing adequate public library service to all residents of a large city is by means of the regional library plan. Establishing an adequate regional library system is less costly than establishing an adequate traditional library system because—while both systems may require the same number of stationary outlets—the former plan includes both large and small units while the latter includes only large units. In addition, since there is much duplication of book titles under the traditional system, inasmuch as all branches are miniature central libraries, it is not possible to have as many distinguished titles in one collection as may be found among the holdings of a large regional library.

## CHAPTER XIII. CONCLUSIONS AND RECOMMENDATIONS

This study was begun with the hypothesis that public library service outlets were not equally accessible to all residents of Boston—adults, young adults, and children. This hypothesis has been tested and validated. There was a stationary outlet within two miles of the home of every adult and young adult in 1963, but children had to travel more than half a mile to reach a public library in several sections of the city.

The hypothesis that adequate public library service was not available to all residents of Boston, even if outlets were equally accessible to all, has also been tested and validated. Where library units were easily accessible, the collections and services provided were not of equal quality and quantity. Adequate public library service for adults and young adults was provided only at the main library, and this library was situated more than two miles from the homes of 395,000 adult and young adult residents.

A third hypothesis, that a high school library with a stock of materials that met established standards provided collections that were superior in quality to the adult and young adult collections of a typical branch library in Boston, was tested in spite of the fact that neither of the two high school libraries in the Boston area that were visited had collections that met school library standards. It should be noted, however, that the better of the two high school library collections was superior to the median branch collection in the areas of adult and young adult fiction, adult and young adult nonfiction, and periodicals. Had the high school libraries that were examined met established standards for collections, it seems likely that the hypothesis would have been completely validated.

The most significant implication of this investigation is that large city libraries must bring the level of service provided by their branches up to the level of service available at the main libraries of independent municipalities serving equivalent populations. In cities where all residents do not live within about two miles of the main library, the main library should not be the only outlet offering adequate public library service to adults and young adults while all the branches serve as little more than children's libraries.

As a result of this study, it is recommended that large city library systems, such as the Boston Public Library, convert from traditional branch systems to regional library systems having regional libraries within two miles of nearly all inhabitants to serve adults, young adults, and children, plus neighborhood libraries to serve primarily children within half mile of each child. With regional library schemes, large city systems could provide higher quality service to all residents than is currently provided by the main libraries in cities and towns of 20,000 to 100,000 population, as well as doing this at a lower cost than is possible with traditional branch systems.

For Boston, Massachusetts, a regional library system with sixty outlets (located as shown in Fig. 6) is recommended. As compared with the present traditional branch system, the recommended regional library system would provide thirty-three more outlets so that all children might have easy access to public library service; eight large, well-distributed outlets with collections of 110,000 volumes each and specialized personnel so that the full range of services might be offered to members of all age groups; and better utilization of bibliothecal staff resulting from the development of larger service areas. This network would give all residents of Boston easy access to adequate public library service for about \$22,000,000 less in capital outlay (at 1964 prices) and for about \$2,000,000 less in annual operating expenditures (at 1961 prices) than would be possible with a strong traditional library system having sixty outlets.

It is suggested that further research be undertaken regarding the maximum distances that adults, young adults, and children may reasonably be expected to travel to reach public library outlets of various types and sizes for various purposes. Changes in the availability of private automobiles and mass transportation facilities, as well as changes in personal attitudes toward walking, have probably affected travel habits during recent years.

Studies should be made of the differences, in terms of socio-economic characteristics, between (1) users of branch libraries who neither travel to the central library nor use interlibrary loan service, (2) users of branch libraries who travel to the central library but do not use interlibrary loan service, (3) users of branch libraries who use interlibrary loan service but do not travel to the central library, and (4) users of branch libraries who both travel to the central library and use interlibrary loan service. Socio-economic factors were generally ignored in this study.

The staffing requirements of public libraries need further investigation. Studies should be made of all library operations so that tasks may be divided into professional and nonprofessional duties on an empirical basis.

Investigations should be undertaken to determine the size of collections of materials, the amount of floor space, and the number of seats required for the various age groups in public library outlets of various types and sizes. As a result of this research, new standards may be developed.

There is furthermore a need to study the feasibility of providing adequate library service to children and young adults through public and school library service. As part of these investigations, the adequacy of public library service for children and young adults in given communities should be compared with the adequacy of school library service for children and young adults in the same communities. One of the hypotheses that could be tested is the one that was not completely validated in the present study, viz., that a high school library with a stock of materials that met established standards provided collections that were superior in quality to the adult and young adult collections of a typical branch library.

Finally, it is suggested that further research be undertaken into the possibility that adequate public library service may be offered to residents of outlying areas of a large city through cooperative agreements involving the large city library and smaller independent public libraries in neighboring suburbs. Up to now, most assistance has been given by the large library to its smaller neighbors, but the large library may be able to receive assistance, too.

## VITA

Leonard Grundt is director of the library and assistant professor at Nassau Community College in Garden City, New York. Born in Brooklyn, New York in 1936, he received a B.A. magna cum laude in Economics from Brooklyn College in 1958, an M.S. in Library Service from Columbia University in 1960, and a Ph.D. in Library Service from Rutgers—The State University in 1965.

He has held positions at the Brooklyn College Library and the Free Public Library of Linden, New Jersey. In 1962-1963, he worked on a research project at the Boston Public Library, and in 1964-1965 was assistant director of the government-sponsored seminar to study problems affecting library service in metropolitan areas, held at Rutgers University.

After experience as a reference librarian in Library/USA at the New York World's Fair, in 1965 he joined the library staff of Nassau Community College, Garden City, New York, as assistant professor and coordinator of instructional services. In 1966 he was appointed deputy director of the library, and in September 1967 became director.

In addition to being a member of two honorary fraternities, Phi Beta Kappa and Beta Phi Mu, Dr. Grundt belongs to the American Library Association, New York Library Association, Nassau County Library Association, and the American Association of University Professors. He has been a contributor to various professional journals and books.
